Deep Learning Seminar

Chapter 15 Representation Learning

Heechul Lim

Department of Information and Communication Engineering

DGIST

2017.01.16

Contents

Contents

- Unsupervised pre-training
- Introduction of supervised(SL) and unsupervised learning(UL)
- Representation
- Clustering
- K-means
- Gaussian Mixture Model
- EM algorithm
- Practical example

Unsupervised Pre-training(UP)

- **Details**
  - Learning **without labelling**
  - Learning only once before joint training
  - **Regularizer or parameter init** that reduces test error
- **Basic idea of UP**
  - **Features** from UP are also useful for SL by using **representation**
  - To draw a car, you need to the number of wheels

Property of UP

- Because it is not mathematically well-defined,
  the way to benefit from UL is not well defined
- The results of whether pretraining is good or bad
- On average, pretraining is slightly detrimental
- But it can be a significant help in many tasks
- You need to understand when and why it works,
  So you can use UL properly

Background of UP

- This way of learning has been recognized for years as a way of learning about in-depth networks since 2006
- But it is rarely used later.
- The reason for this is that as of 2010
- ReLU, dropout, maxout, data augmentation and deterministic batch normalization methods are introduced
- It is possible to get better performance by SL without using UP

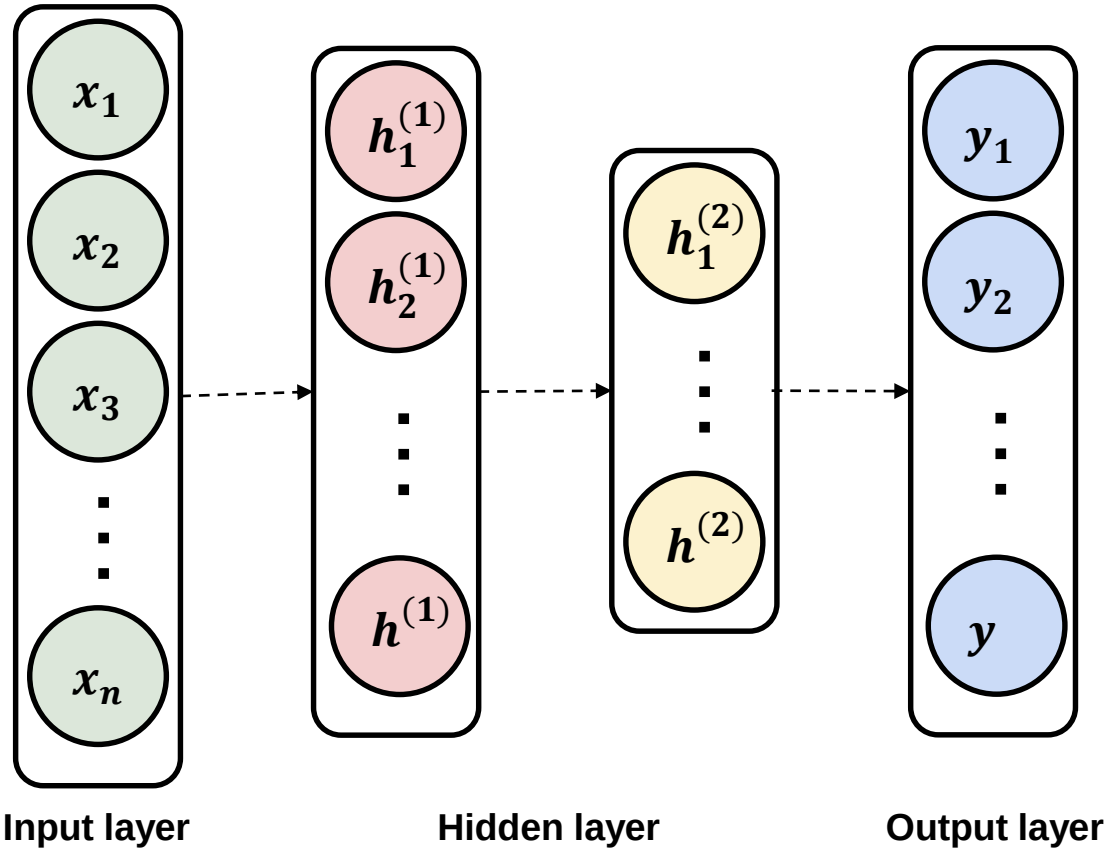
Pros of unsupervised pre-training(UP)

- **Shared representations**
  - To handle multiple domains
  - To transfer learned knowledge to many other tasks
- **Data sets used**
  - In order to learn neural network, many data are needed
  - However, there are many data which do not have label but little label data
  - In this case, it is possible to pre-train each layer

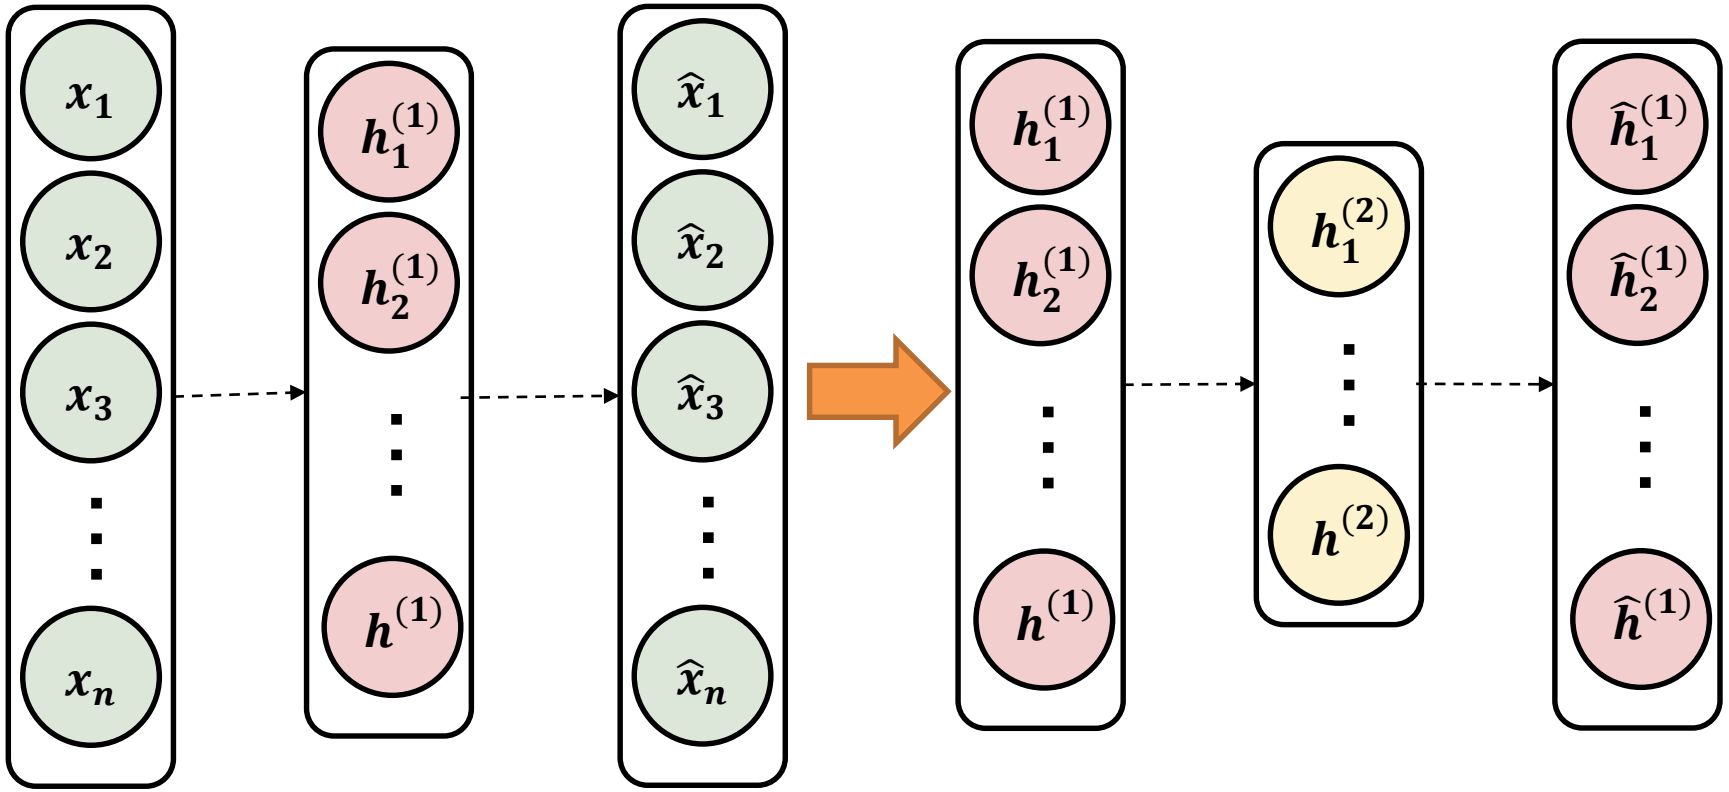
Greedy layer-wise UP in the book

- UL per a single layer basis
- Greedy
  - It progresses by layer
- Pretraining
  - It runs only once before joint training
- Regularizer or parameter init that reduces test error

Pre-training for deep neural network example

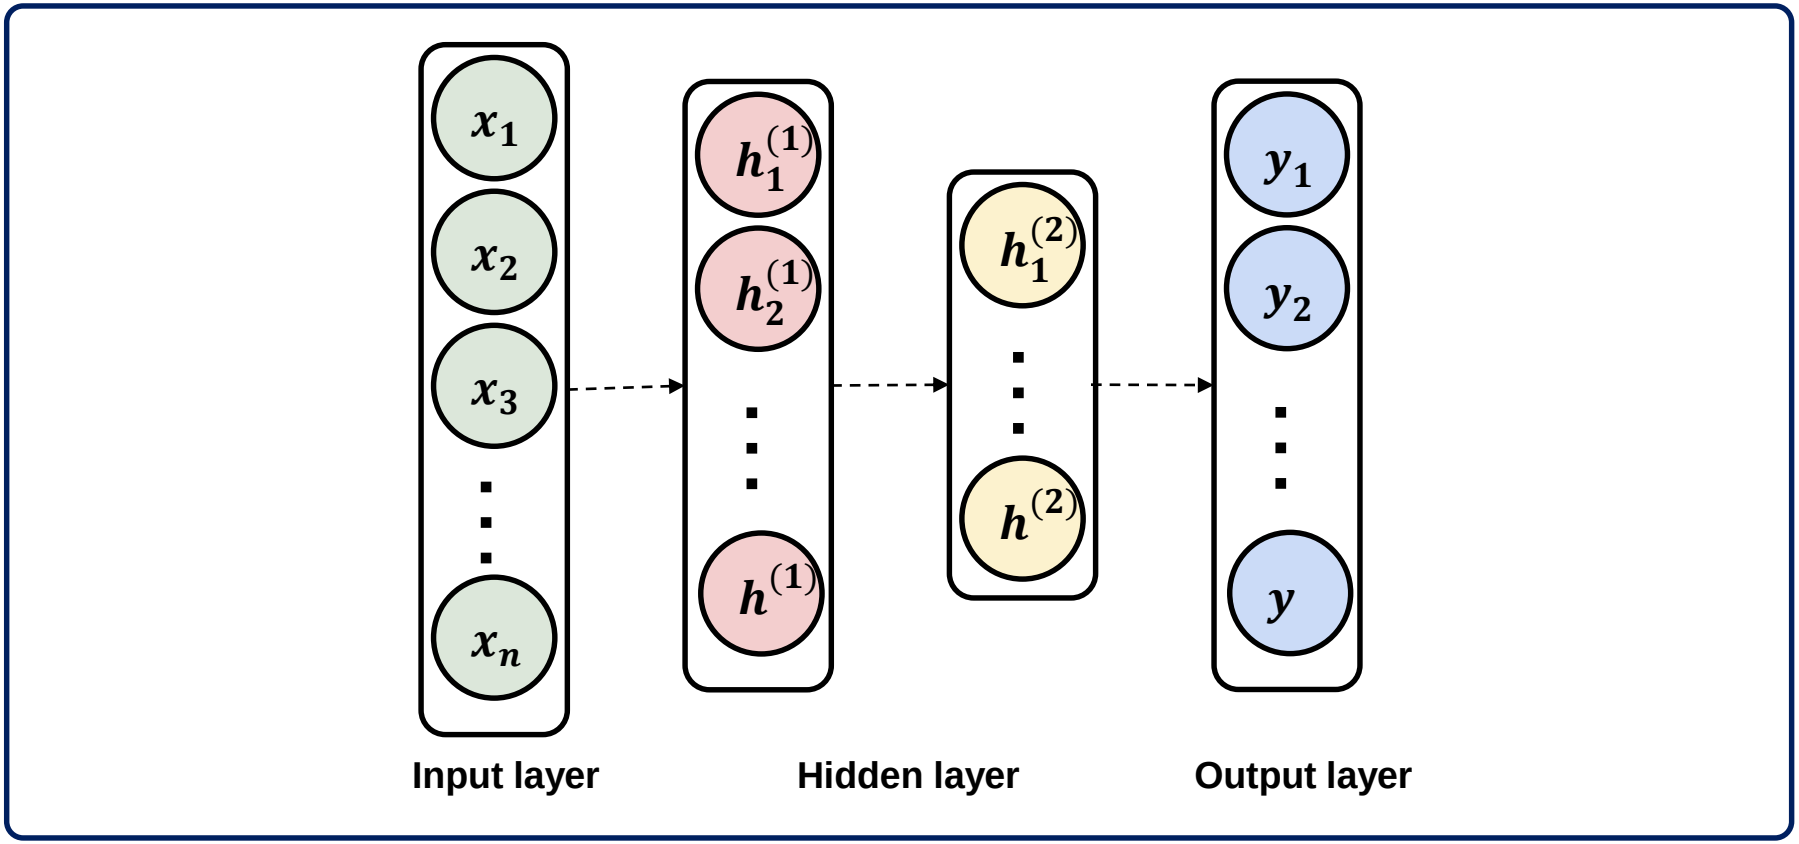


Greedy layer-wise UP



Combining layers after pre-training

- **After combining layers**
  - The parameters for each layer have been determined
  - It is then possible to perform supervised fine-tuning



Introduction of SL and UL

- **Supervised Learning**
  - **Classification**
    A classification problem is when the output variable is a category, such as “red” or “blue” or “disease” and “no disease”
  - **Regression**
    A regression problem is when the output variable is a real value, such as “dollars” or “weight”
- **Unsupervised Learning**
  - **Clustering**
    It is where you want to discover the inherent groupings in the data, such as grouping customers by purchasing behavior

Introduction of SL and UL

- **Supervised Learning**
  - Let's say you are a real estate agent

Bedrooms	Sq. feet	Neighborhood	Sale price
3	2000	Normaltown	$250,000
2	800	Hipsterton	$300,000
2	850	Normaltown	$150,000
1	550	Normaltown	$78,000
4	2000	Skid Row	$150,000

Bedrooms	Sq. feet	Neighborhood	Sale price
3	2000	Hipsterton	???

https://medium.com/@ageitgey/machine-learning-is-fun-80ea3ec3c471

Supervised Learning

- Let’s solve the problem with solutions(labels)

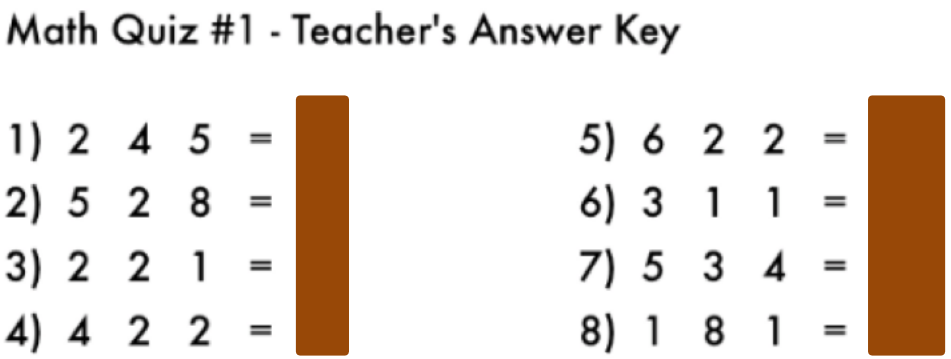
Math Quiz #1 - Teacher's Answer Key

1)	2	4	5	=	3	5)	6	2	2	=	10
2)	5	2	8	=	2	6)	3	1	1	=	2
3)	2	2	1	=	3	7)	5	3	4	=	11
4)	4	2	2	=	6	8)	1	8	1	=	7

https://medium.com/@ageitgey/machine-learning-is-fun-80ea3ec3c471

Unsupervised Learning

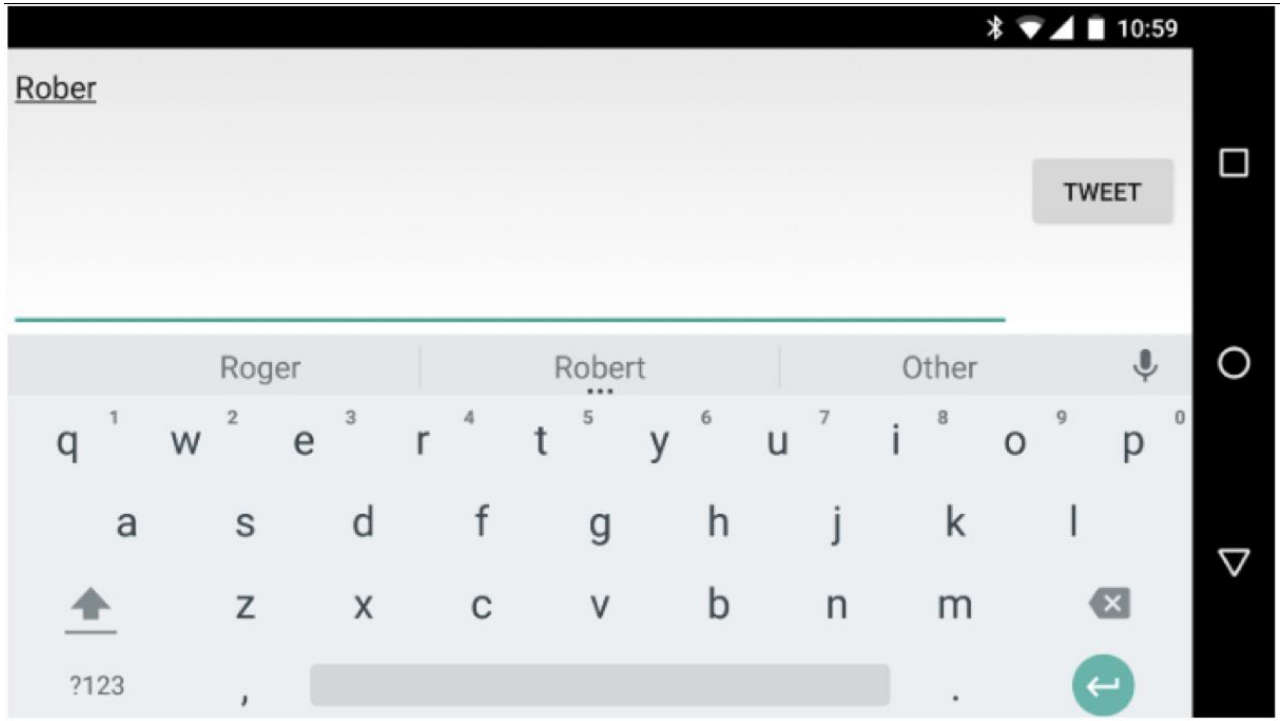
- **I don’t know what these numbers mean**
  but maybe you(computer) can figure out
- **Goal**
  - **modeling the underlying structure or distribution in the data in order to learn more about the data**



https://medium.com/@ageitgey/machine-learning-is-fun-80ea3ec3c471

Predicting the next letter in Phone keyboard

- One cool use might be auto-predict for a phone keyboard



https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Predicting the next letter in a story

- **As we just start to train the RNN, after a 100 train loops**

hjCTCnhoofeoxelif edElobe negnk e iohehasenoldndAmdaI ayio pe e h'e
btentmuhgehi bcgdltt. gey heho grpiahe.
Ddelnss.eelaishaner" cot AAfhB ht ltny
ehbih a"on bhnte ectrsnae abeahngy
amo k ns aeo?cdse nh a taei.rairrhelardr er deffijha

- **After about 1000 iterations**

hing soor ither. And the caraos, and the crowebel for figttier and ale the room of
me? Streat was not to him Bill-stook of the momansbed mig out ust on the bull,
out here. I been soms
inick stalling that aid.
"Hon't me and acrained on .Hw's don't you for the roed," In's pair."

- **After several thousand more iterations, it looks pretty good**

He went over to the gate of the café. It was like a country bed.
"Do you know it's been me."
"Damned us," Bill said.
"I was dangerous," I said. "You were she did it and think I would a fine cape you,"
I said.

https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

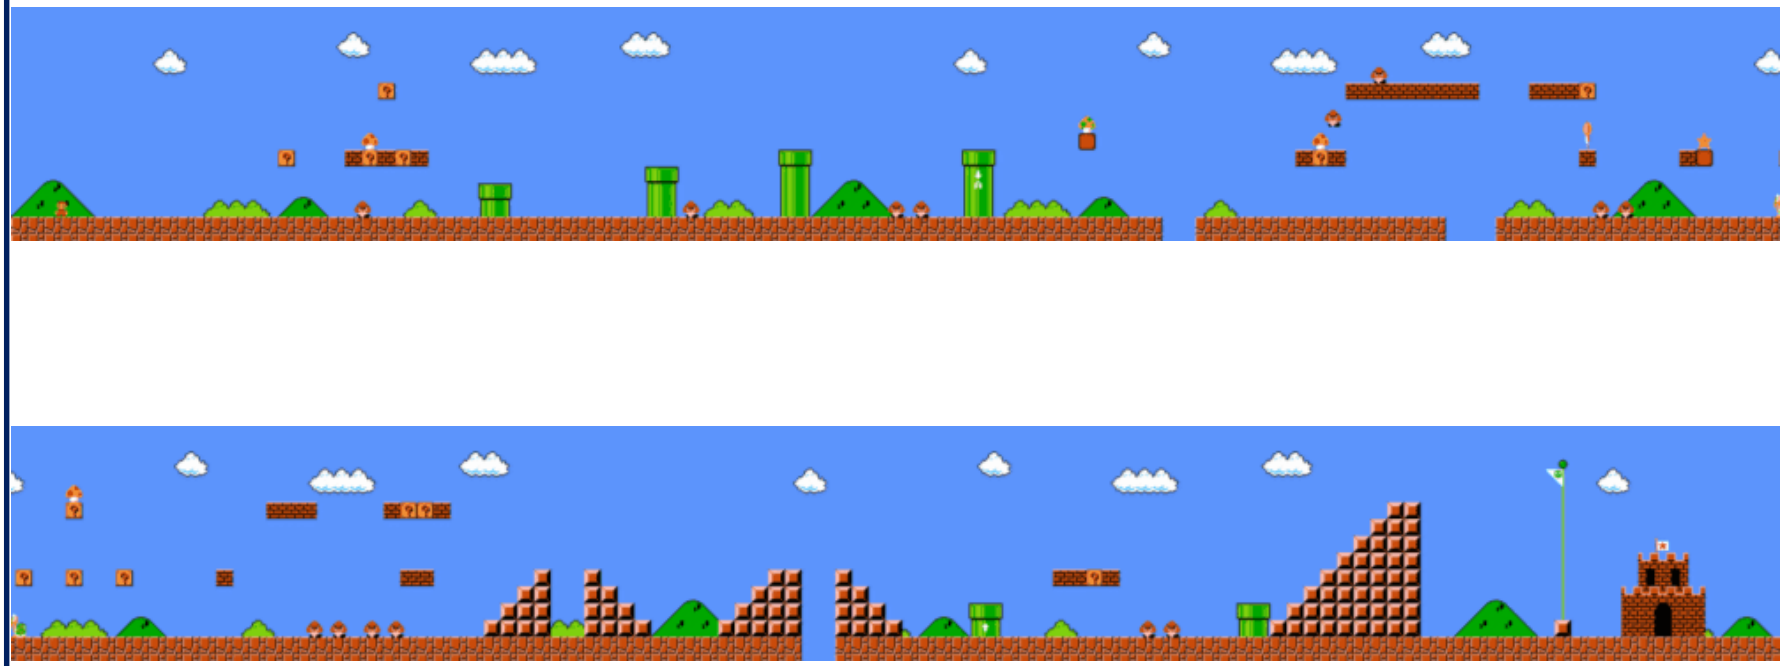
Mario game

- **Making Mario without actually Making Mario**

https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Mario game

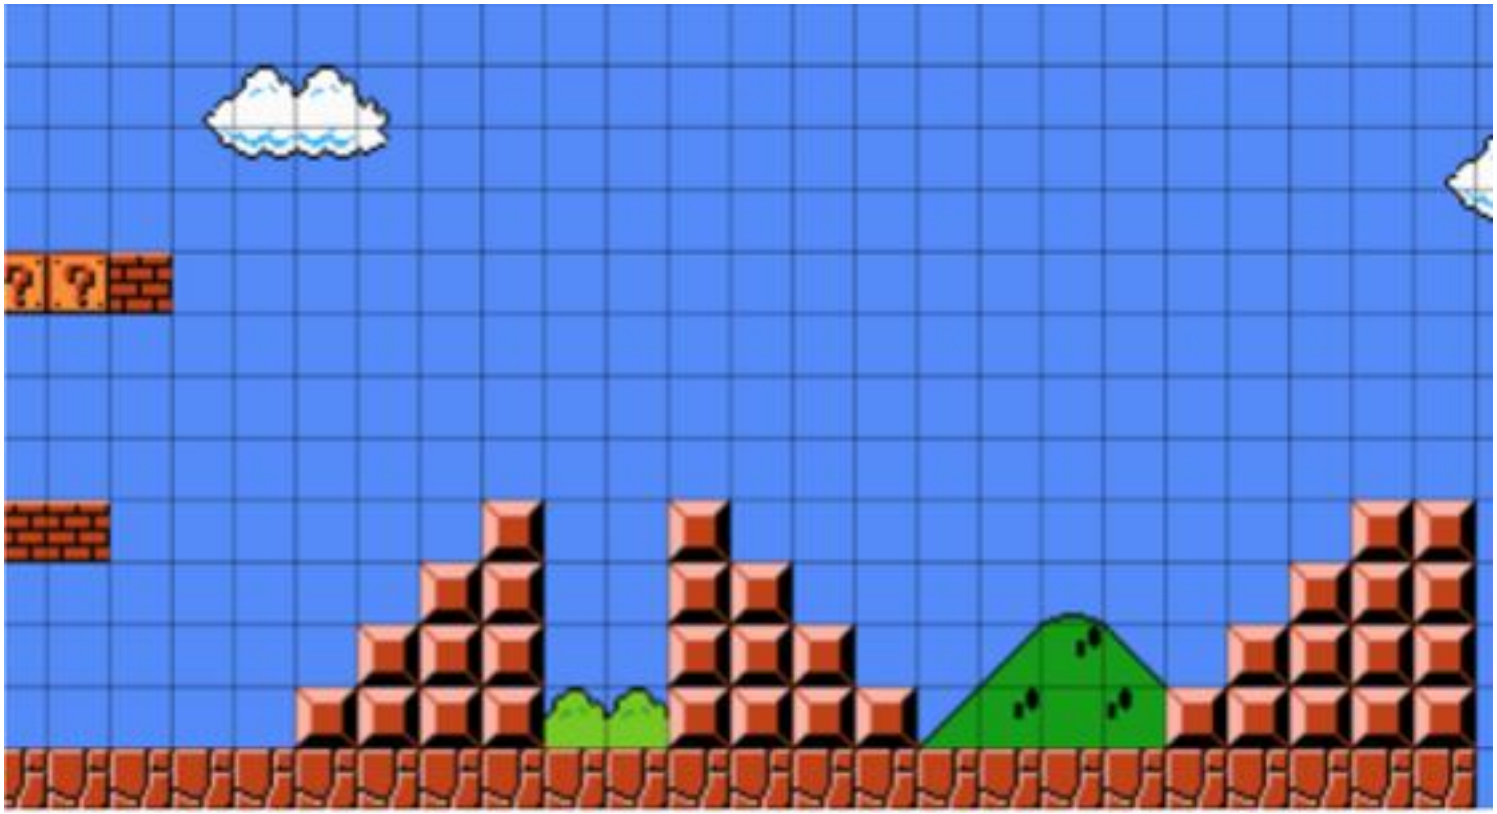
- The first level from the game



https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Mario game

- Simple grid of objects

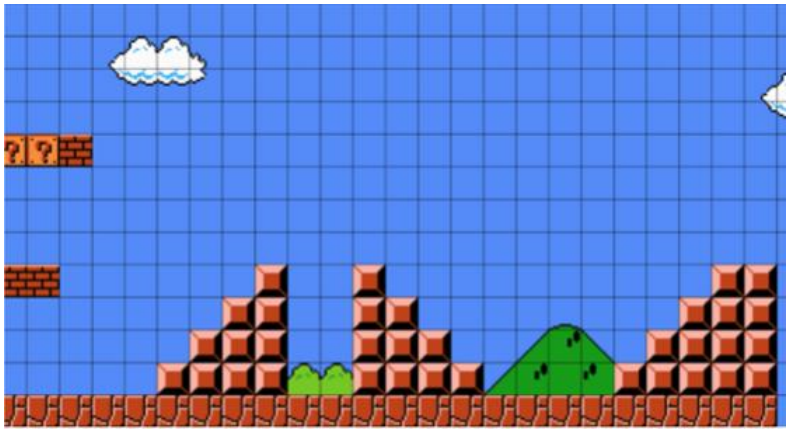


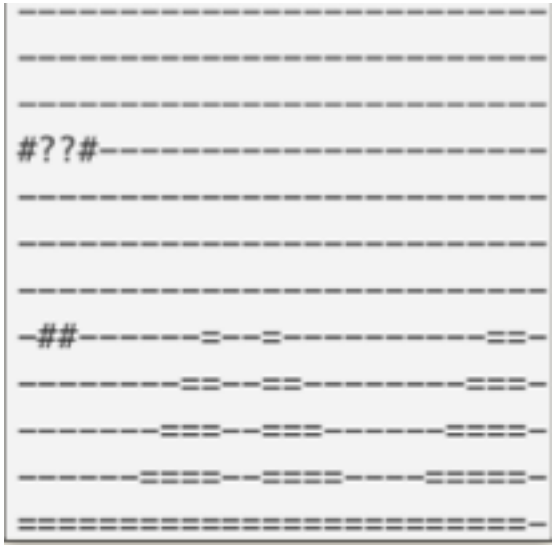
https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Mario game

- **Converting this grid as a sequence of characters**

‘-’ is a blank space
‘=’ is a solid block
‘#’ is a breakable brick
‘?’ is a coin block



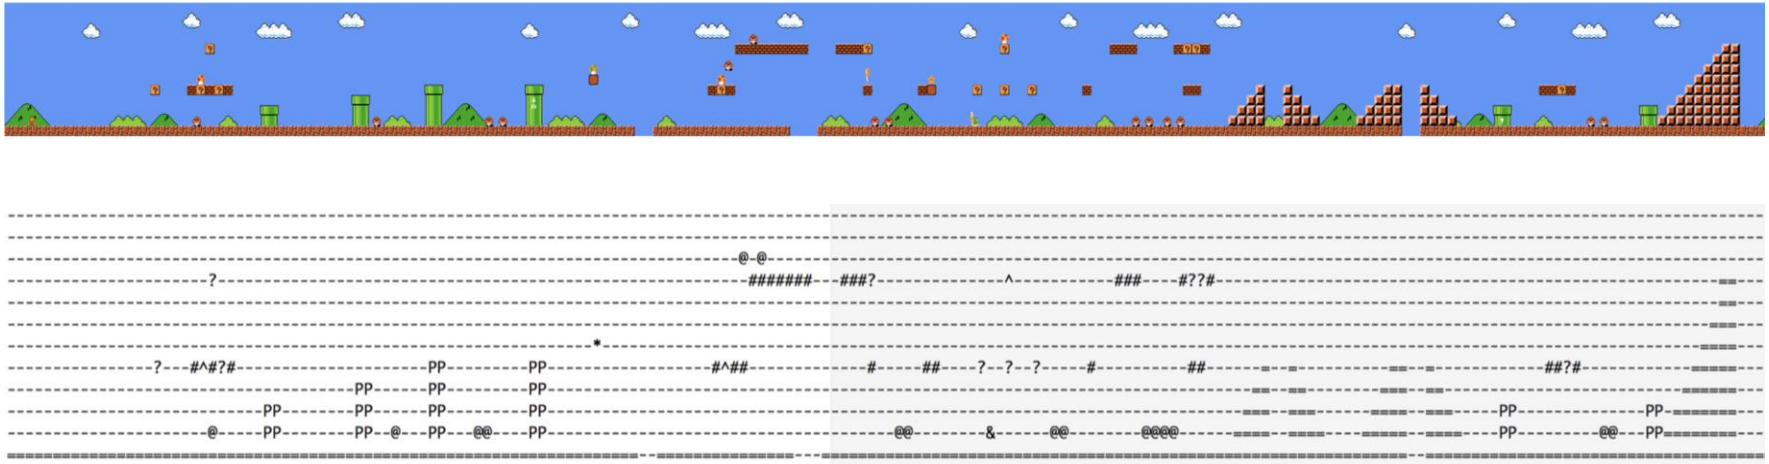


https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Mario game

- **Converting this grid as a sequence of characters**

‘-’ is a blank space
‘=’ is a solid block
‘#’ is a breakable brick
‘?’ is a coin block

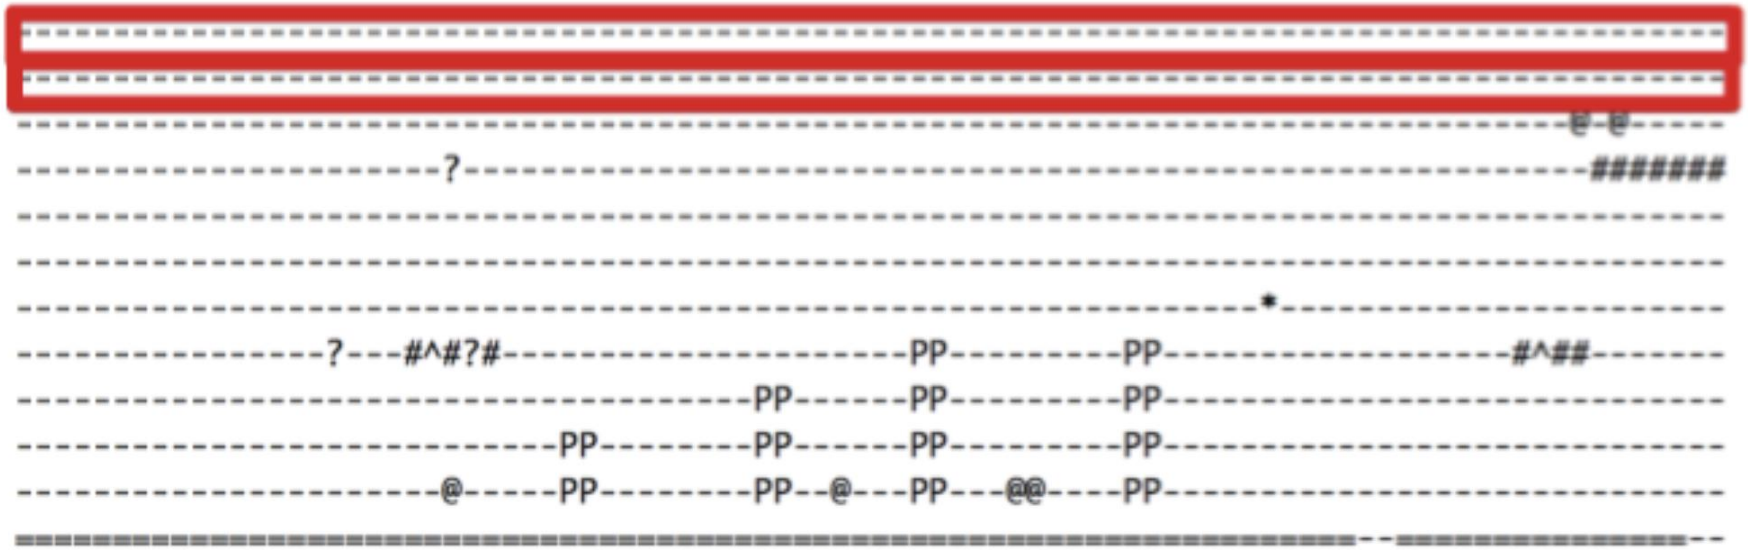


https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Patterns

- **Mario levels don’t really have a pattern in row-by-row**

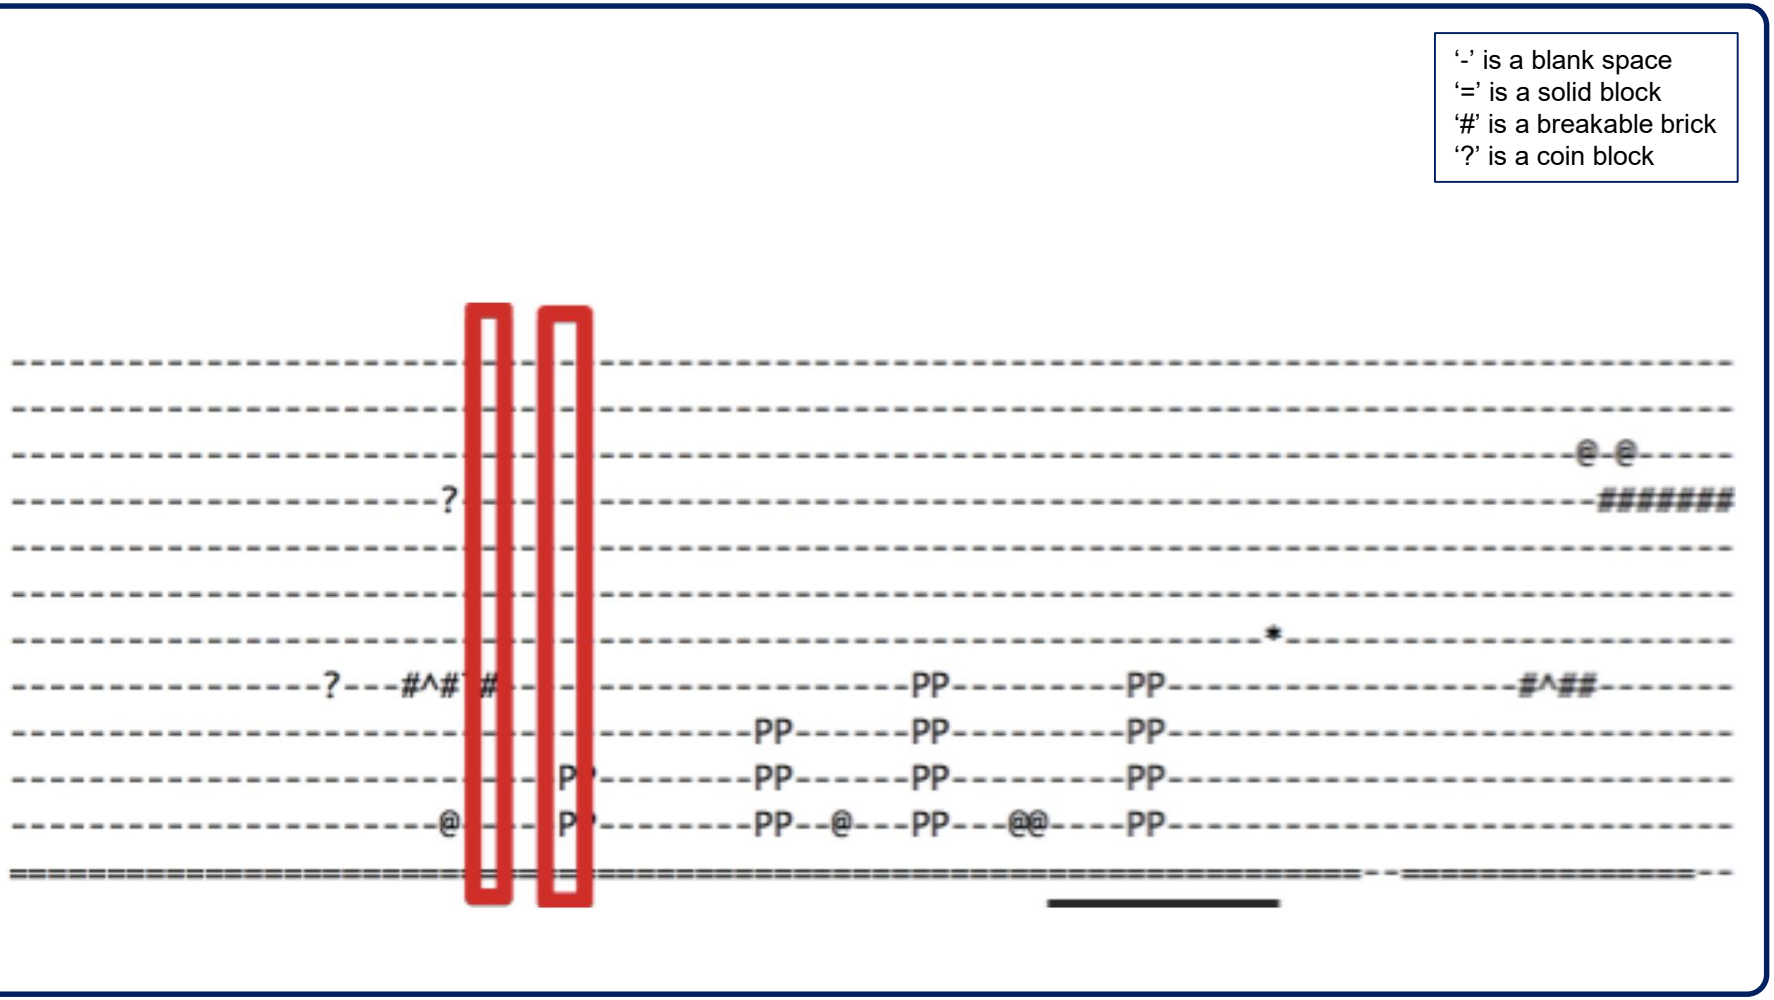
‘-’ is a blank space
‘=’ is a solid block
‘#’ is a breakable brick
‘?’ is a coin block



https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Patterns

- There's a real pattern in column-by-column



https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Generating mario level

- After a little training, our model is generating junk

```
------------------------
LL+<&=------P------------
--------
--------------------T--#--
-----
-=--=-=-----------=-&--T-------------
```

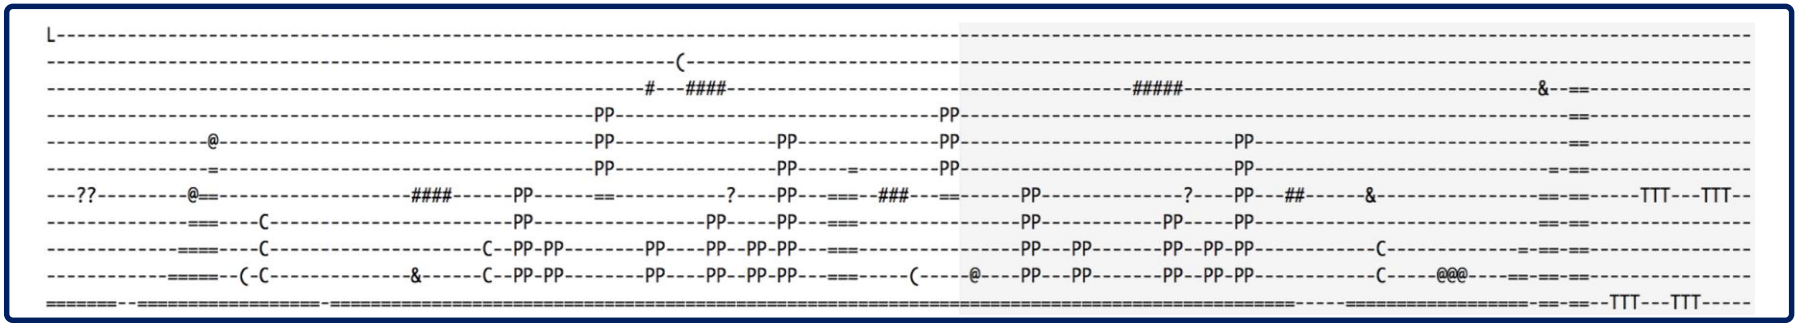
- After several thousand iterations
  - The model has almost figured out that each line should be the same length.
  - It has even started to figure out some of the logic of Mario
  - The pipes in mario are two blocks wide and at least two blocks high, so the “P”s in the data should appear in 2x2 clusters

```
----------=
--------PP=
--------PP=
----------=
----------=
```

https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Generating mario level

- **With a lot more training**
  - It put a Lakitu (the monster that floats on a cloud) up in the sky at the beginning of the level—just like in a real Mario level.
  - It knows that pipes floating in the air should be resting on top of solid blocks and not just hanging in the air.
  - It places enemies in logical places.
  - It doesn't create anything that would block a player from moving forward.
  - It feels like a real level from Super Mario Bros. 1



https://medium.com/@ageitgey/machine-learning-is-fun-part-2-a26a10b68df3

Mario game

- This model is generated from very little data
- There just aren't enough levels in the Mario game
- With the thousands of user-created levels,
  we could make an amazing model.
- The difference between a good and a bad program
  - How much data you have to train your models

Unsupervised pre-training(UP)

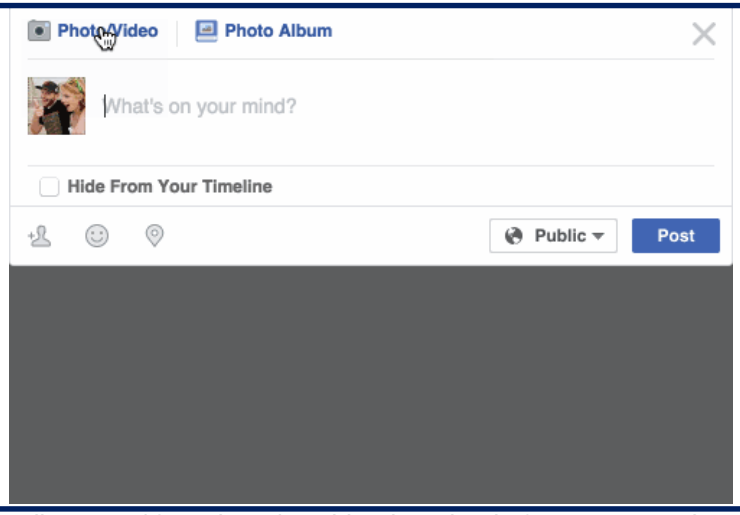
- **Details**
  - Learning **without labelling**
  - Learning only once **before joint training**
  - **Regularizer or parameter init** that reduces test error
- **Basic idea of UP**
  - **Features** from UP are also useful for SL by using **representation**
  - To draw a car, you need to the number of wheels

Representation

- Information processing becomes easy or difficult
  - Depending on how information is represented
- Numbers are easy to divide
  - But difficult if they are romanized
- Good representation makes it easy to follow up
- Neural network learns how to represent
- The previous steps learn how to express
  - To the last softmax classifier
- Many representation learning faces a tradeoff
  - Between preserving information and obtaining good attributes

Face recognition

- Taging everyone for you like magic by Facebook
- Recognizing your friends' faces
  after they have been tagged only a few times.
- 98% accuracy which is much as good as humans can do!
- Pushing this tech to the limit to solve a challenging problem
  - Will Ferrell apart from Chad Smith



https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition

- They are different people!

https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition process

- 1: Look at a picture and find all the faces in it
- 2: Focus on each face and be able to understand that
  - Even if a face is turned in a weird direction or in bad lighting, it is still the same person.
- 3: Pick out unique features of the face
  - You can use to tell it apart from other people
- 4: Compare the unique features of that face to all the people

https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

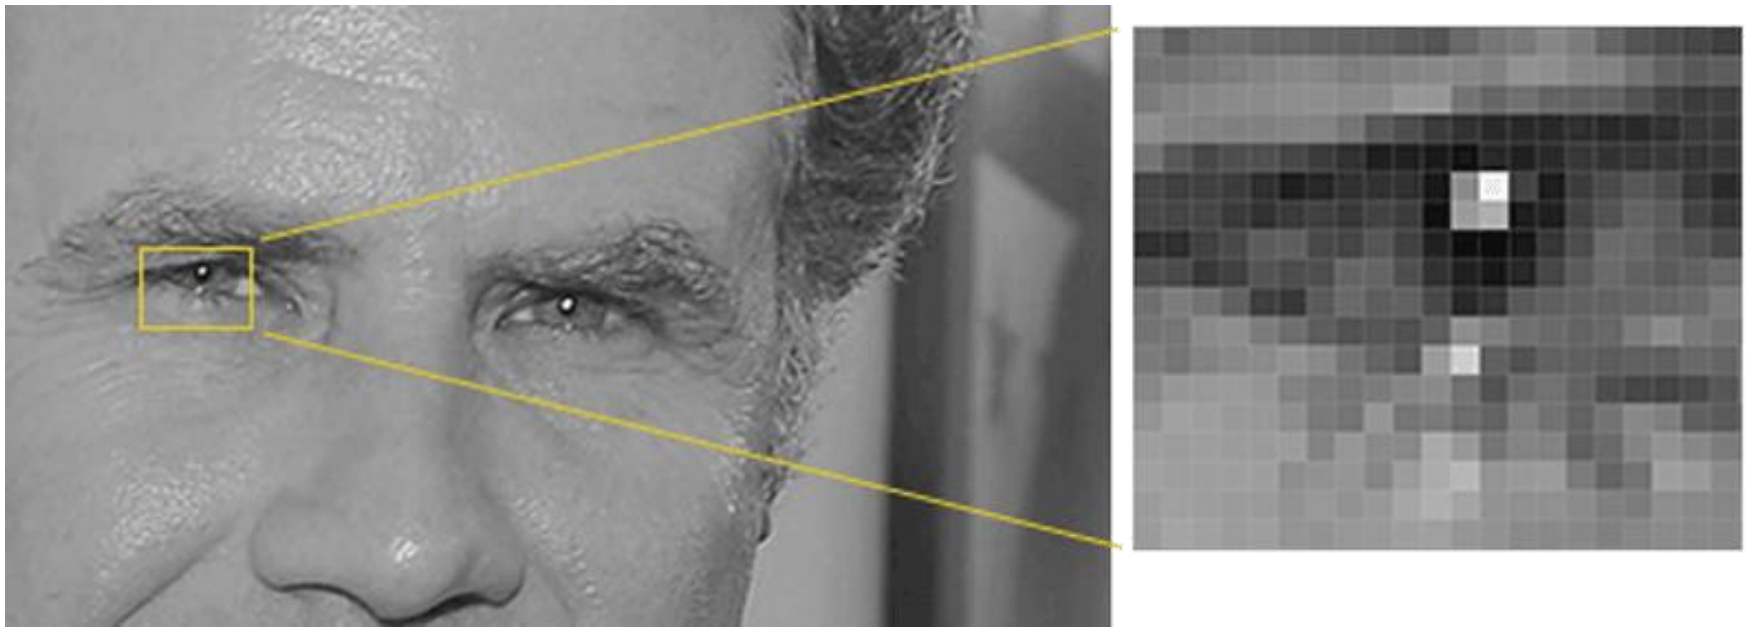
Face recognition process

- **To find faces in an image**
  - **we'll start by making our image black and white because we don't need color data to find faces**

https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition process

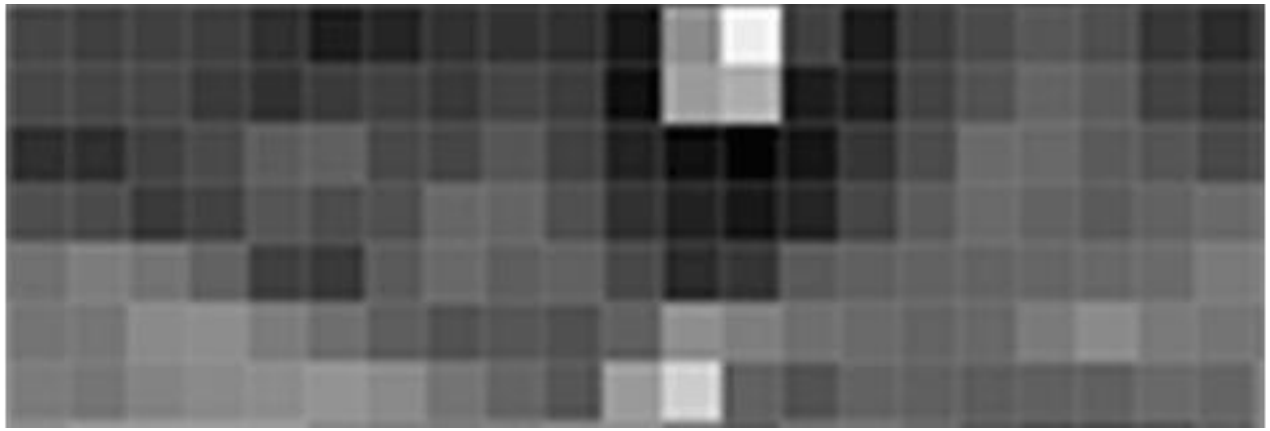
- For every single pixel, look at the pixels that surrounding it
- Our goal
  - Figuring out how dark the current pixel
  - Then we want to **draw an arrow** showing in which direction the image is getting darker



https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition process

- Every pixel is replaced by an arrow
- These arrows are called *gradients*
- They show the flow from light to dark



https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition process

- There's a reason for replacing the pixels with gradients
  - If we analyze pixels directly, dark images and light images of the same person will have different pixel values
- But saving the gradient for every single pixel
  - Too much detail
  - Missing the forest for the trees

https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

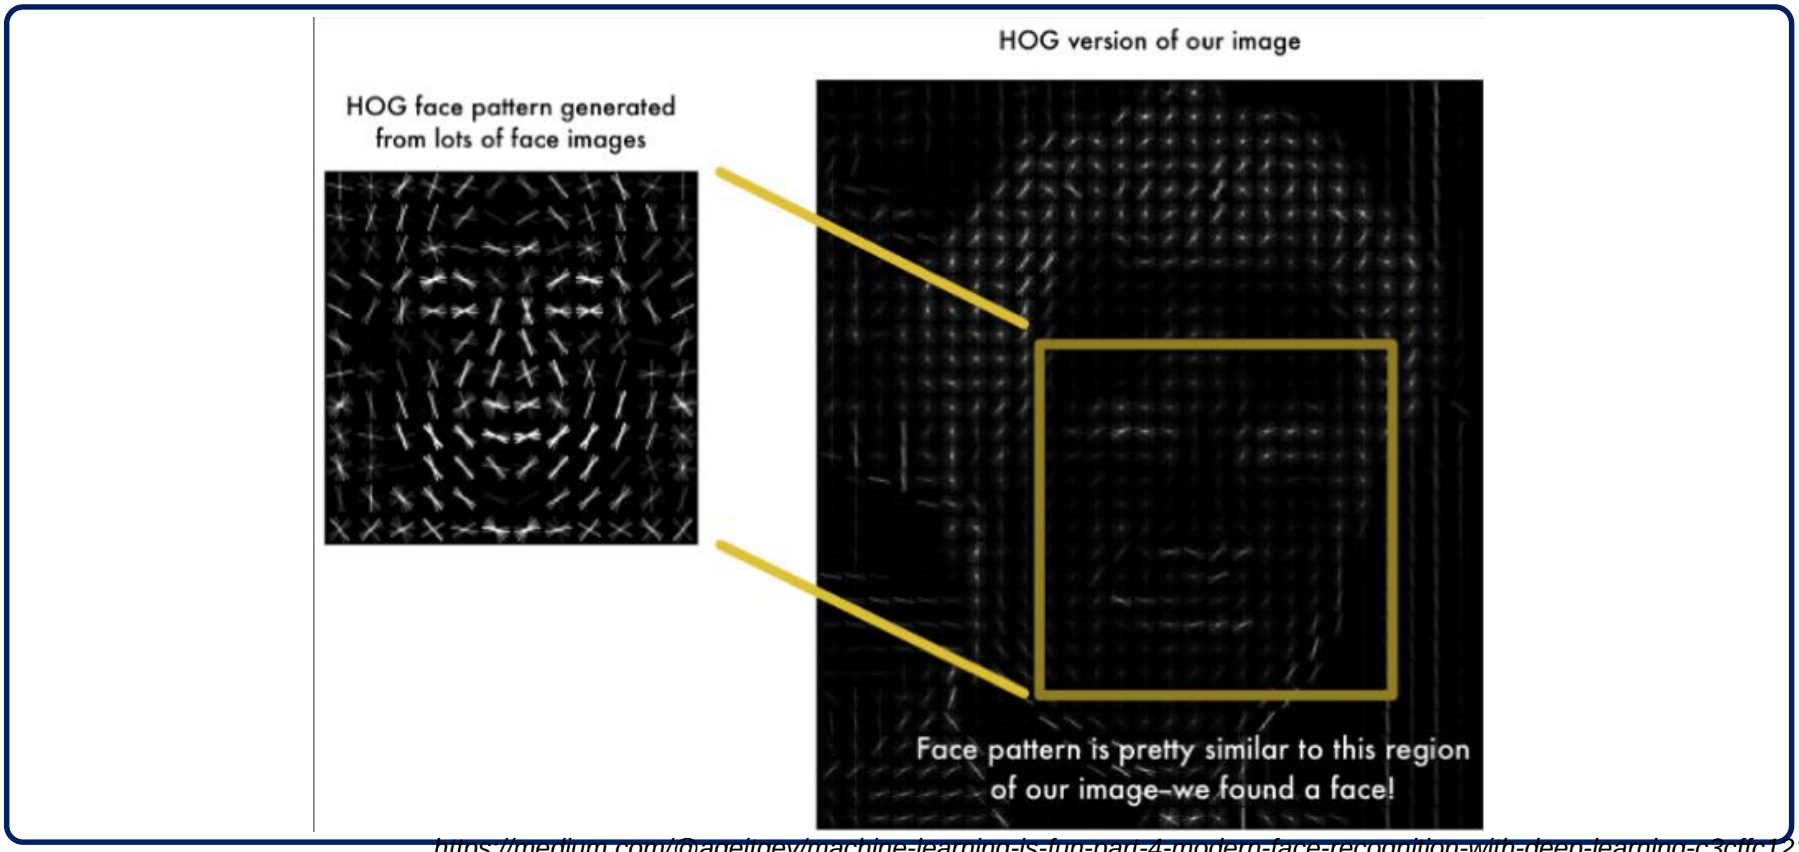
Face recognition process

- Breaking up the image into squares of 16x16 pixels each
- The end result is we turn the original image
  - Into a very simple representation

https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition process

- **To find faces in this HOG image**
  - **Find the part of our image that looks the most similar to a known HOG pattern that was extracted from other faces**



https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition process

- There's actually a huge problem with that approach
  - That would take way too long
  - They need to be able to recognize faces in milliseconds, not hours
- What we need is a way to extract a few measurements from each face
  - The size of each ear, the space between the eyes, etc.
- After repeating this step millions of times for millions of images of thousands of different people
  - The neural network learns to reliably generate 128 measurements for each person
  - Machine learning people call the 128 measurements of each face an embedding

https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Face recognition process

Input Image

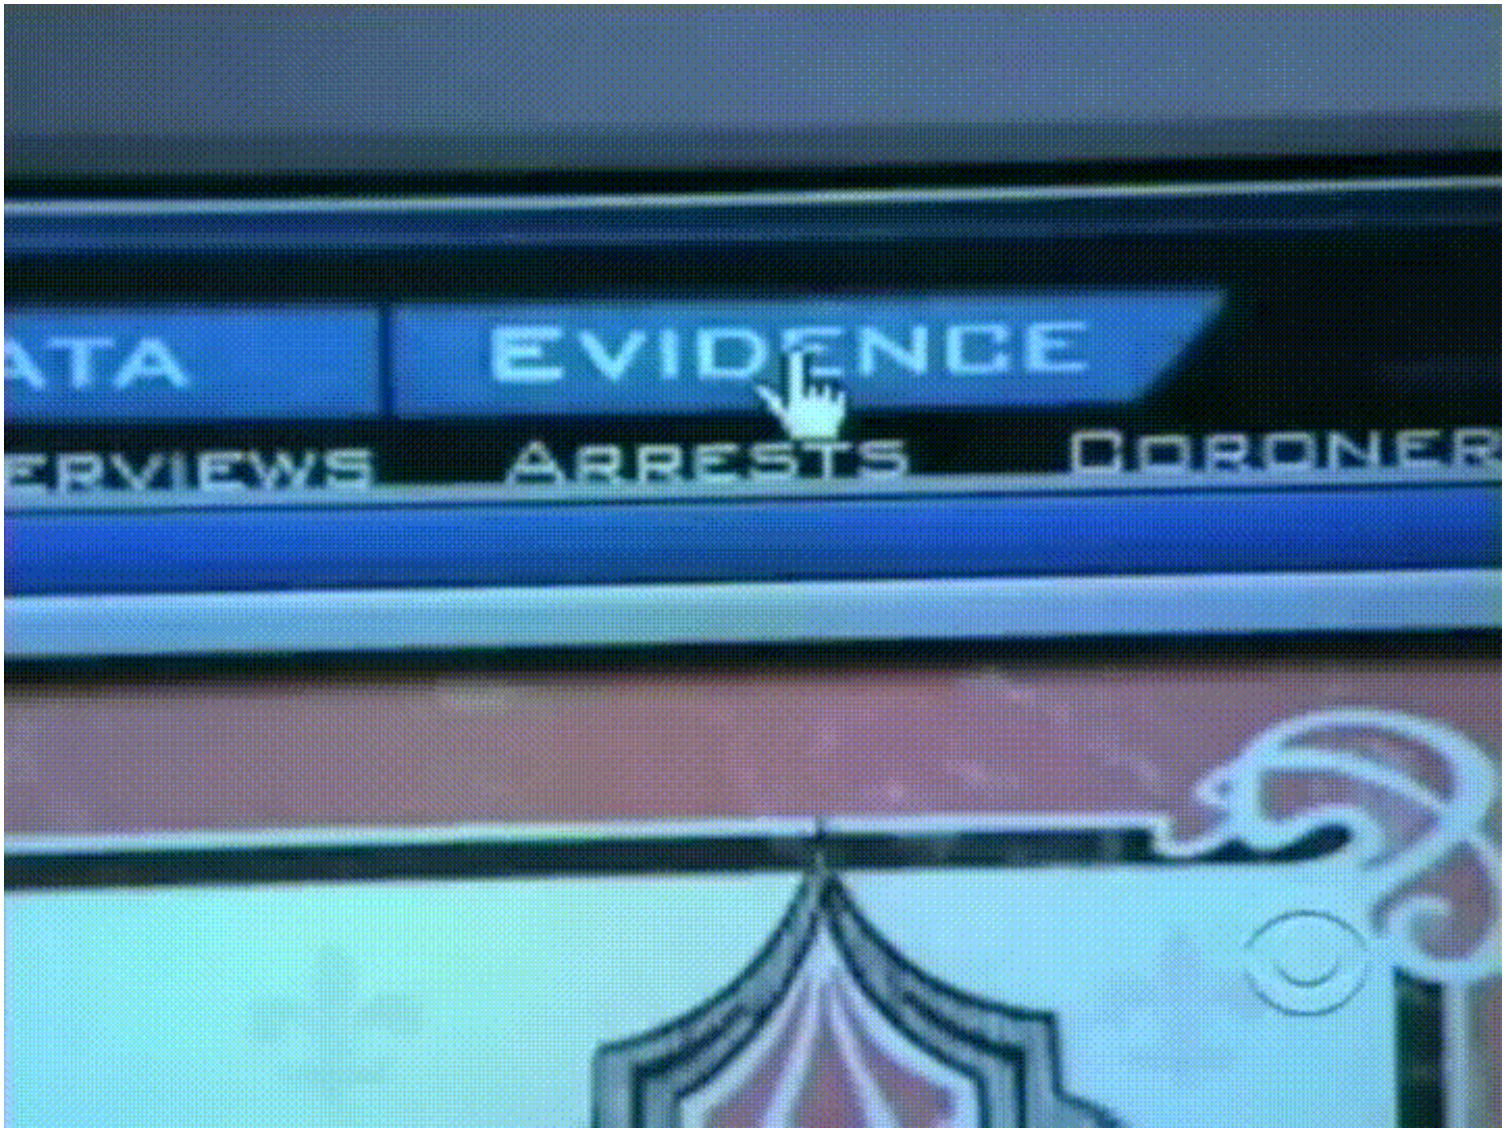
https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

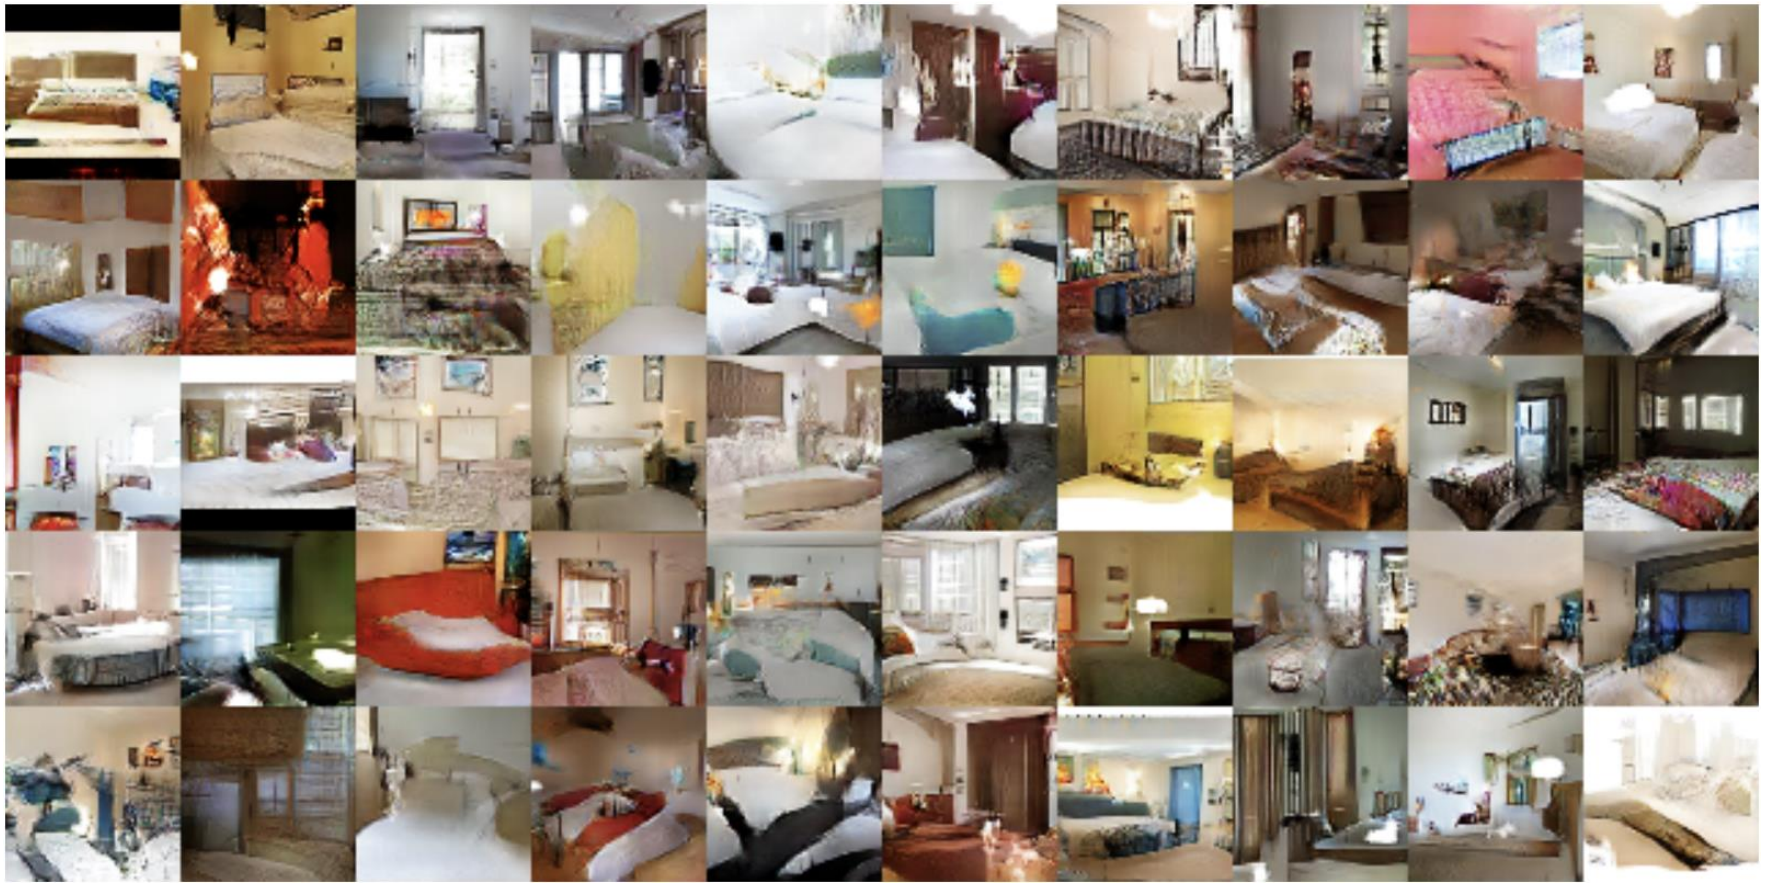
Face recognition process



https://medium.com/@ageitgey/machine-learning-is-fun-part-4-modern-face-recognition-with-deep-learning-c3cffc121d78

Generative models

- **These pictures of bedrooms were dreamt up by a DCGAN**



https://medium.com/@ageitgey/abusing-generative-adversarial-networks-to-make-8-bit-pixel-art-e45d9b96cee7

Generative models

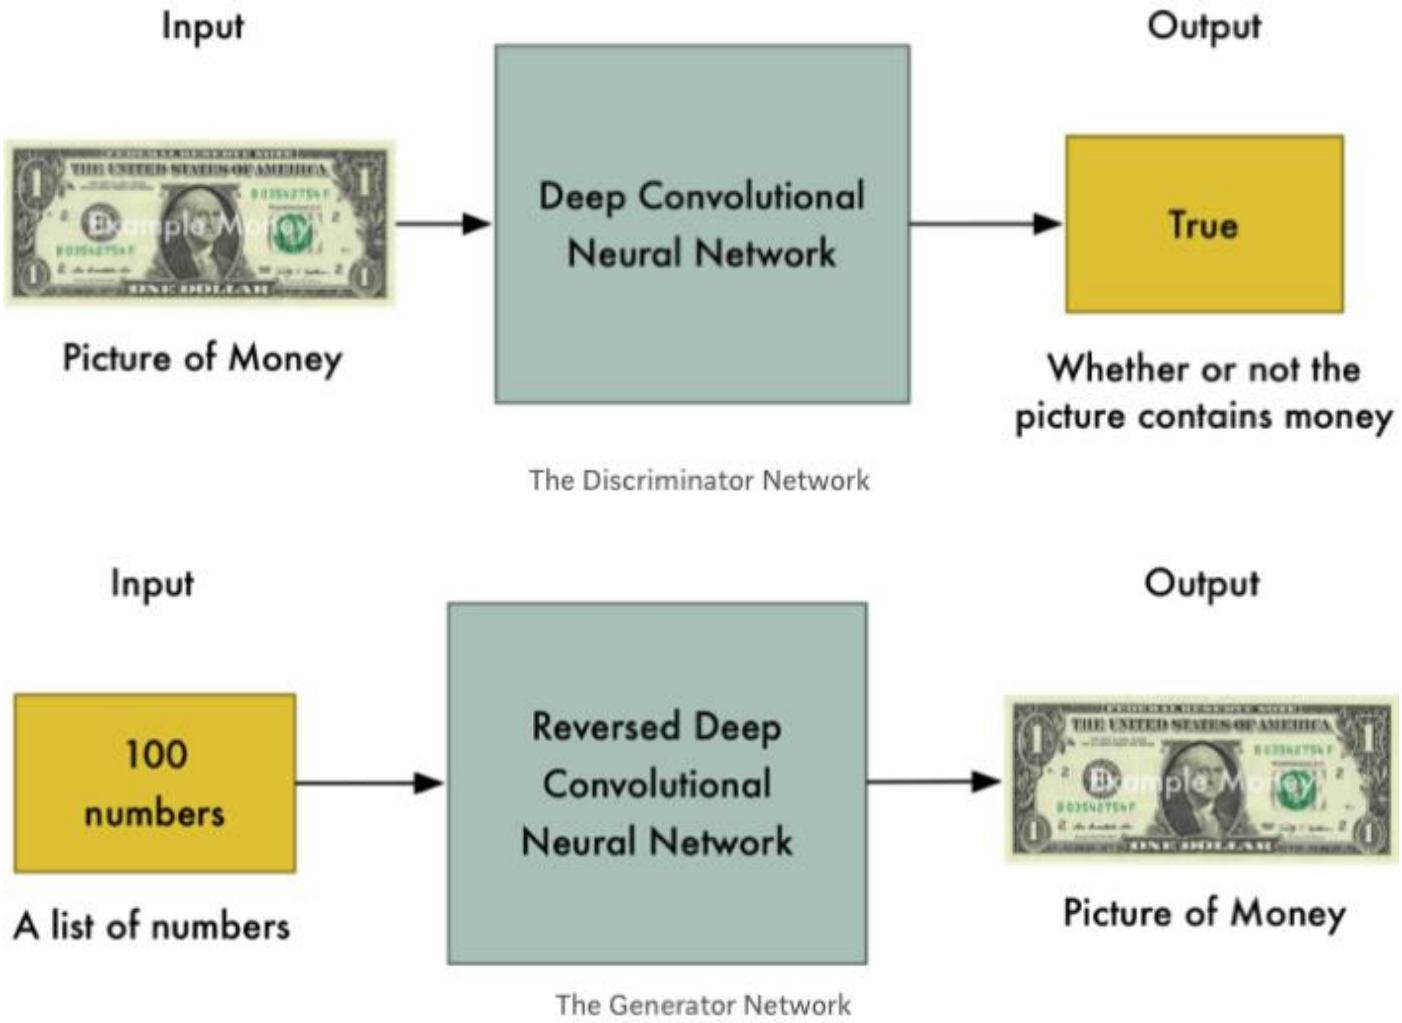
- **If the computer was able to do this and the pictures**
  - **It produced had the right number of legs, tails, and ears**
  - **Computer knows what parts go into making up a “dog”**

https://medium.com/@ageitgey/abusing-generative-adversarial-networks-to-make-8-bit-pixel-art-e45d9b96cee7

Generative models

- To build a DCGAN, we create two deep neural networks
- Then we make them fight against each other
- In the process, they both become stronger
- This first neural network is called the Discriminator
- This second neural network is called the Generator

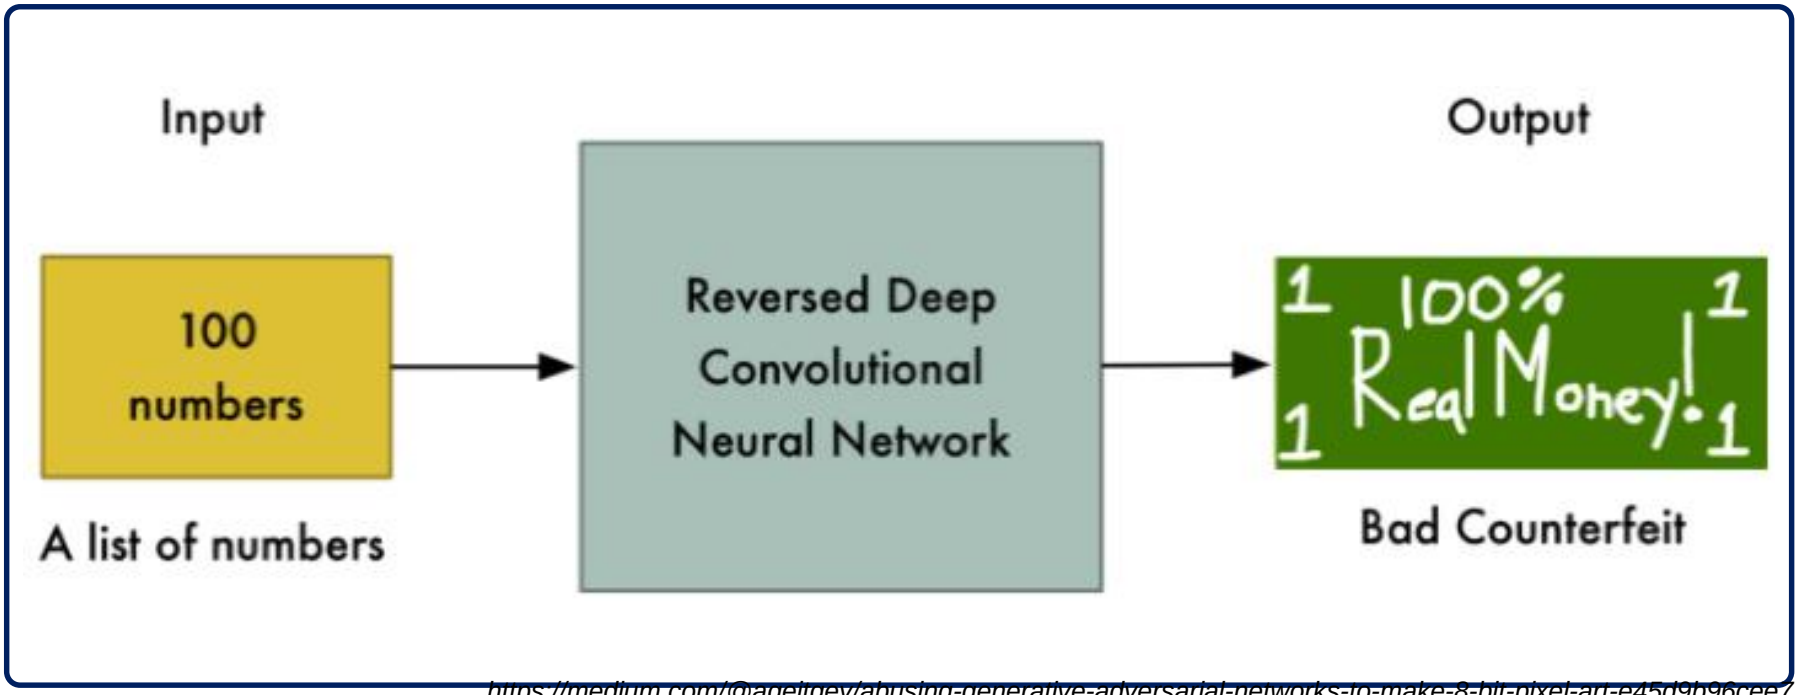
Generative models



https://medium.com/@ageitgey/abusing-generative-adversarial-networks-to-make-8-bit-pixel-art-e45d9b96cee7

Generative models

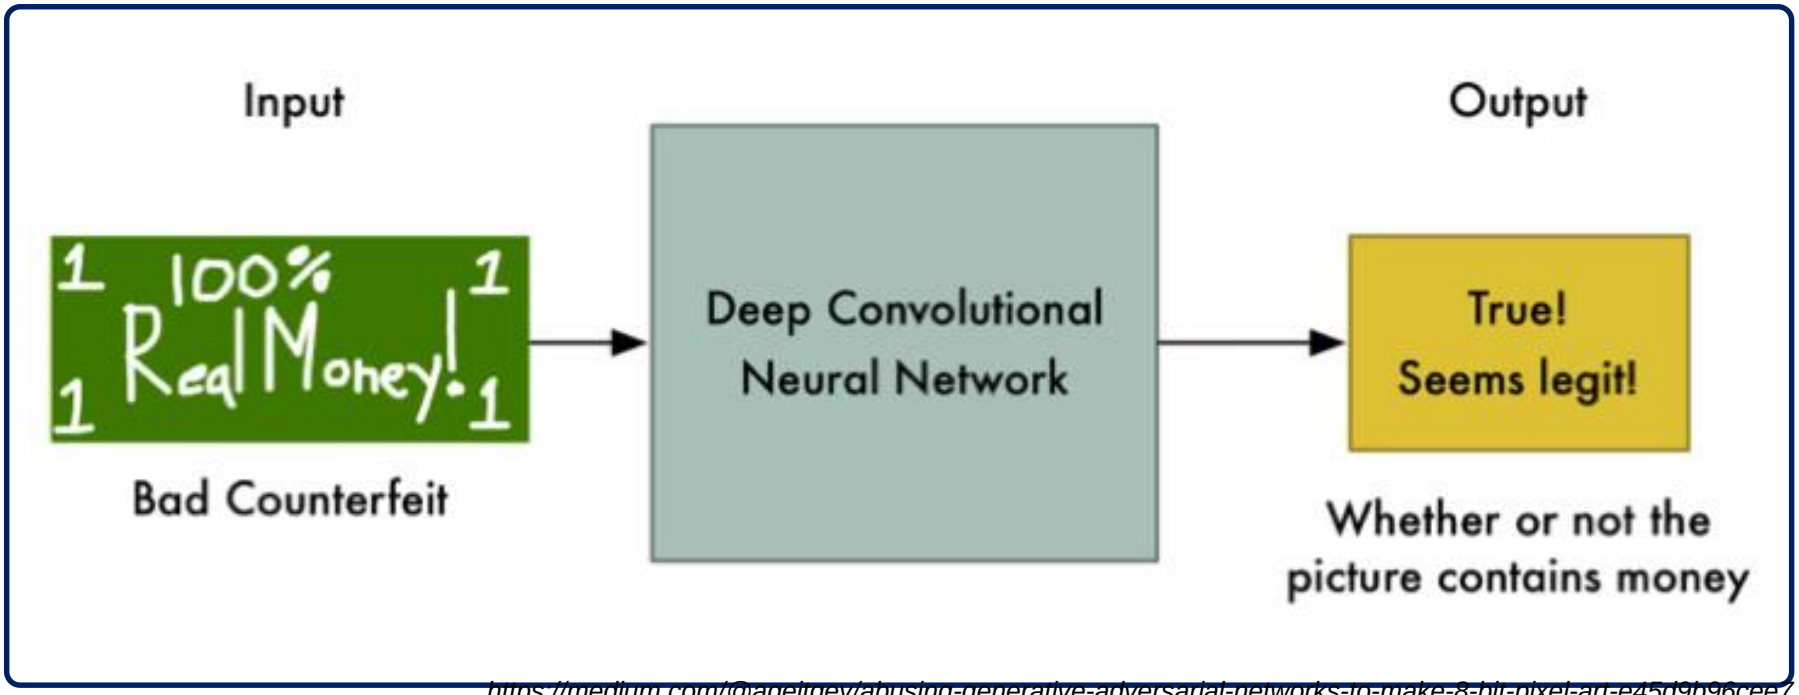
- **Let's make them battle!**
- **In the first round**
  - **The Generator makes the first (terrible) fake dollar**



https://medium.com/@ageitgey/abusing-generative-adversarial-networks-to-make-8-bit-pixel-art-e45d9b96cee7

Generative models

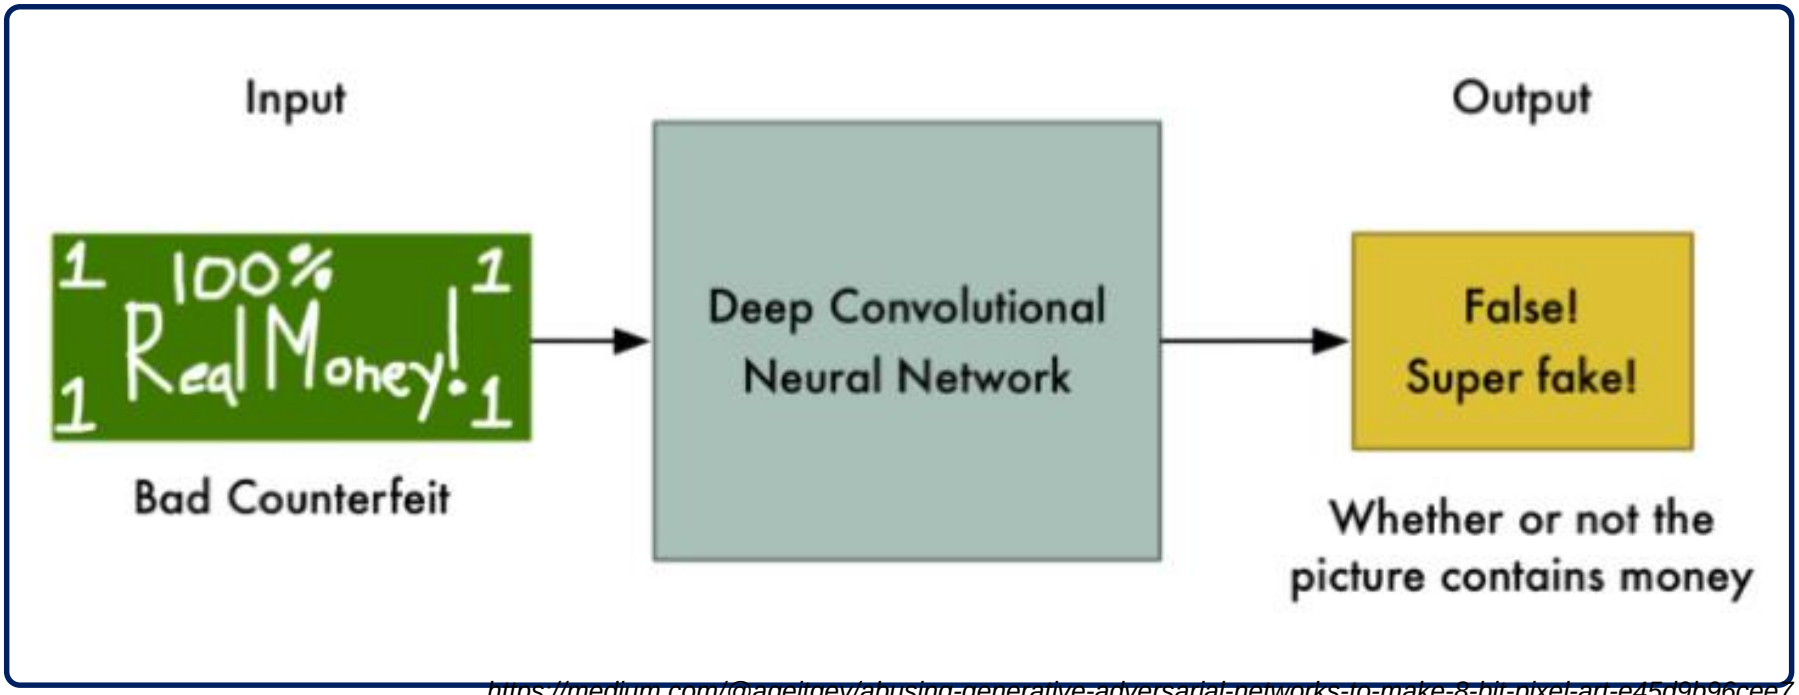
- **The Discriminator is equally terrible at it's job, so it won't know the difference**



https://medium.com/@ageitgey/abusing-generative-adversarial-networks-to-make-8-bit-pixel-art-e45d9b96cee7

Generative models

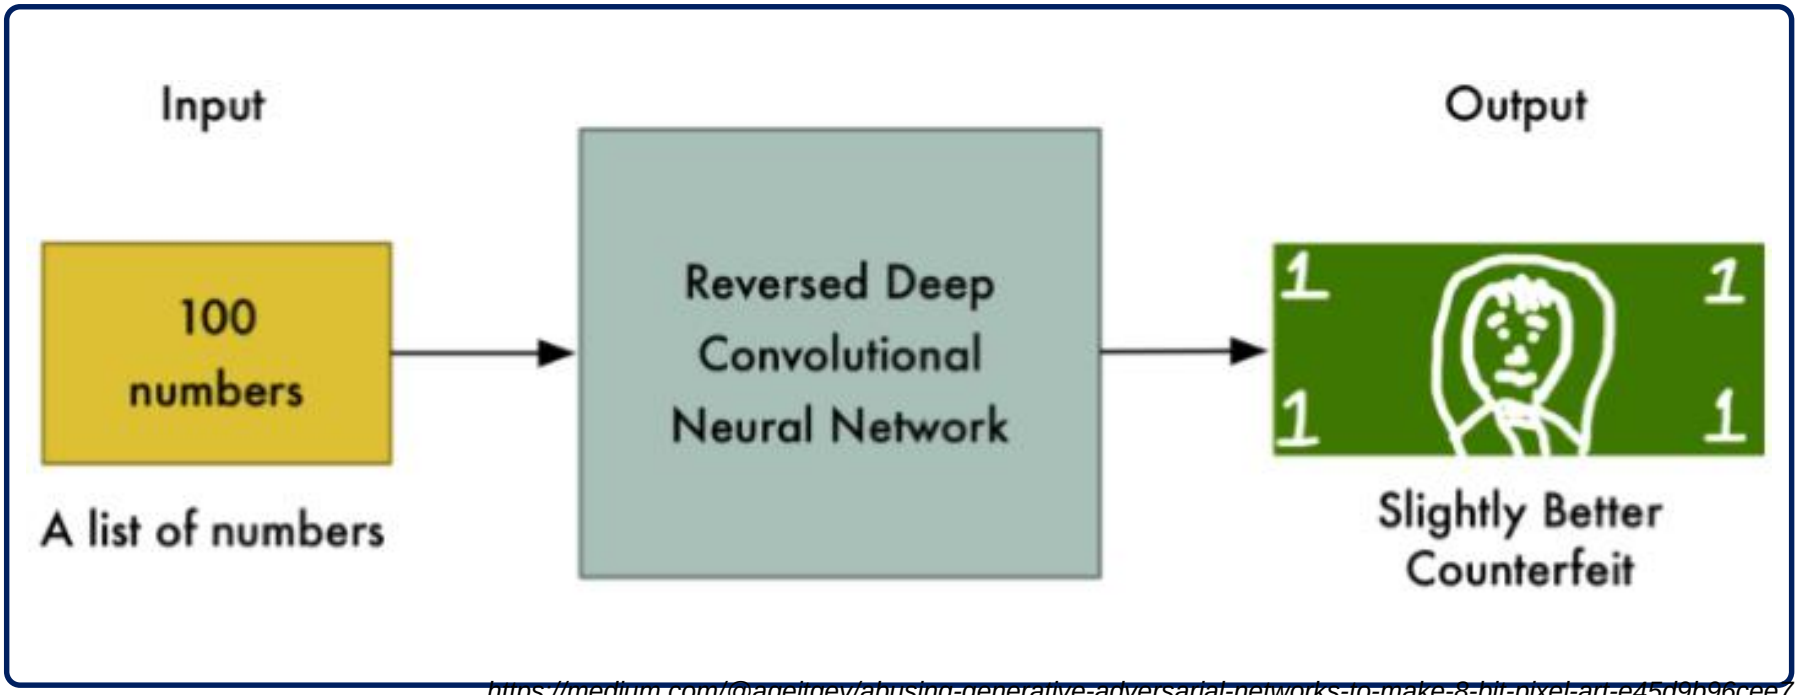
- **The Discriminator levels up!**
- **It now can spot very bad fake dollars.**



https://medium.com/@ageitgey/abusing-generative-adversarial-networks-to-make-8-bit-pixel-art-e45d9b96cee7

Generative models

- The Generator makes a slightly better counterfeit dollar
- This back-and-forth game between them
  - Continuing thousands of times until both networks are experts



https://medium.com/@ageitgey/abusing-generative-adversarial-networks-to-make-8-bit-pixel-art-e45d9b96cee7

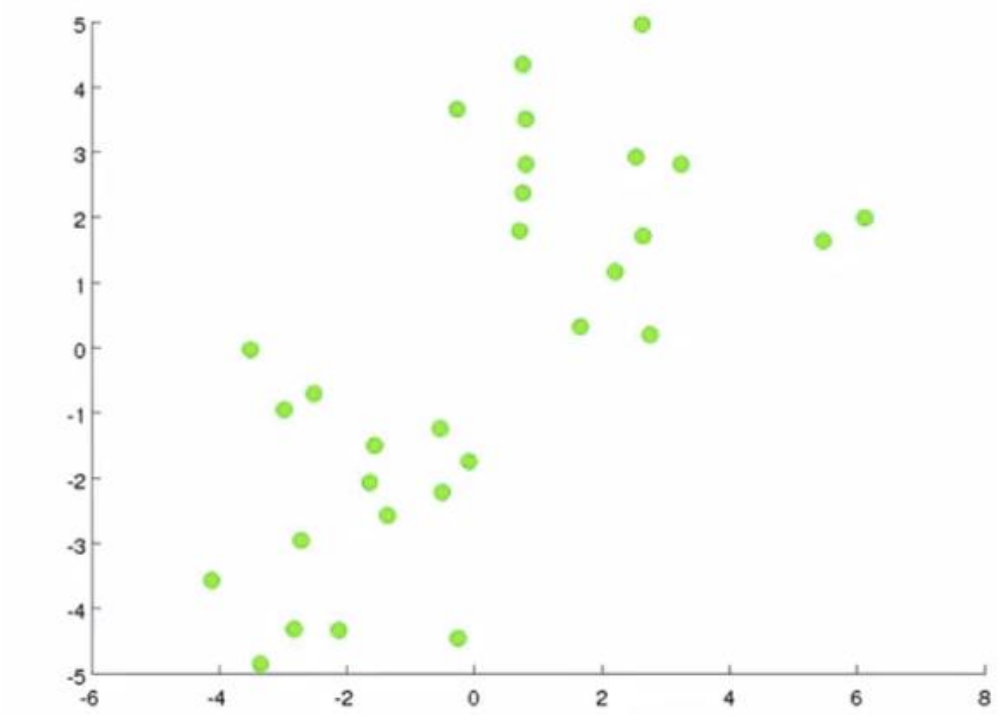
Clustering

- **Details**
  - Clustering is a kind of Unsupervised Learning,
    finding a cluster that best describes given data without label
  - Classification requires data and labels for each data
  - In practice, there are many cases where data exists
    but it does not know what label or category it is
  - Sometimes it is necessary to explain the data
    through a method other than classfication
- **K-means**
- **Gaussian Mixture Model(GMM)**

K-means clustering

- **Find the K clusters that best describes the data**

$$\min_{b,w} \sum_{i}^{n} \sum_{j}^{k} w_{ij} \|x_i - b_j\|_2^2 \text{ s.t. } \sum_{j} w_{ij} = 1, \forall j$$

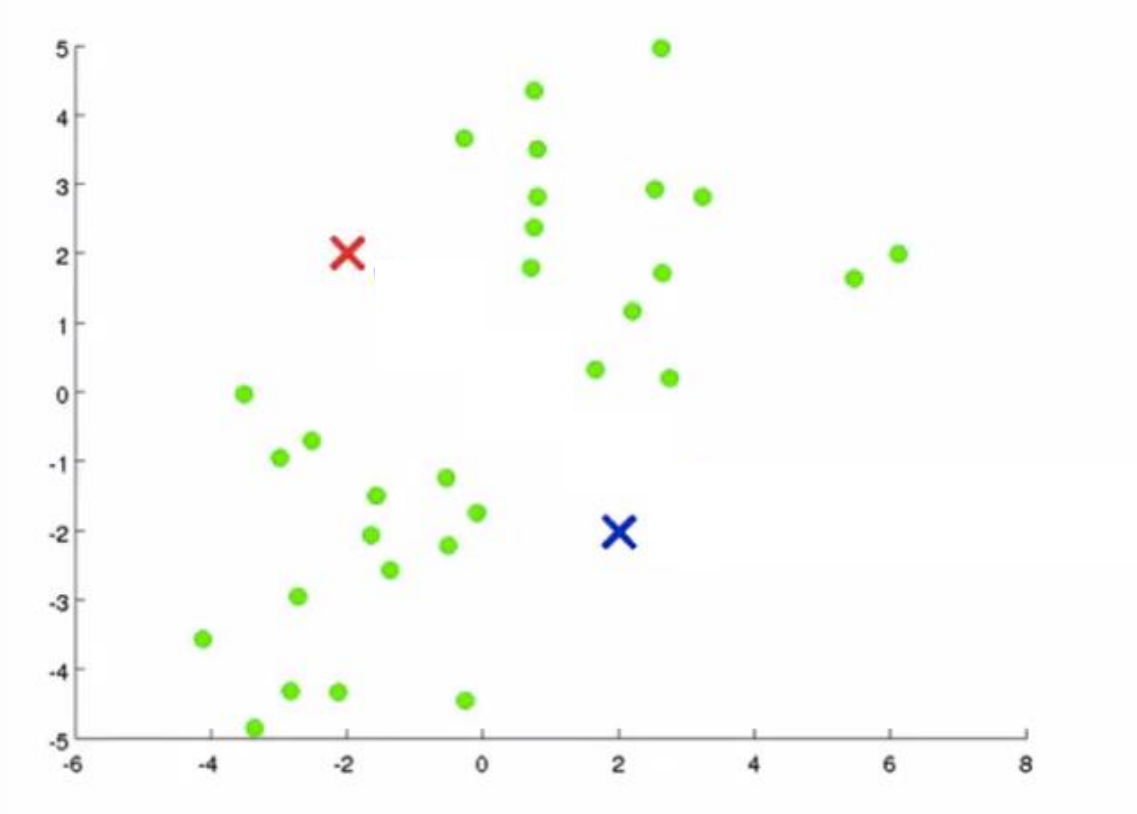


n: # of data
k: # of clusters
I: index of data
j: index of cluster
b_j: center of j-th cluster
w_{ij}: if i-th data is in j-th cluster, it is 1
else, it is 0

** Slides from Andrew Ng(Stanford Univ.), "Machine Learning"*

K-means clustering

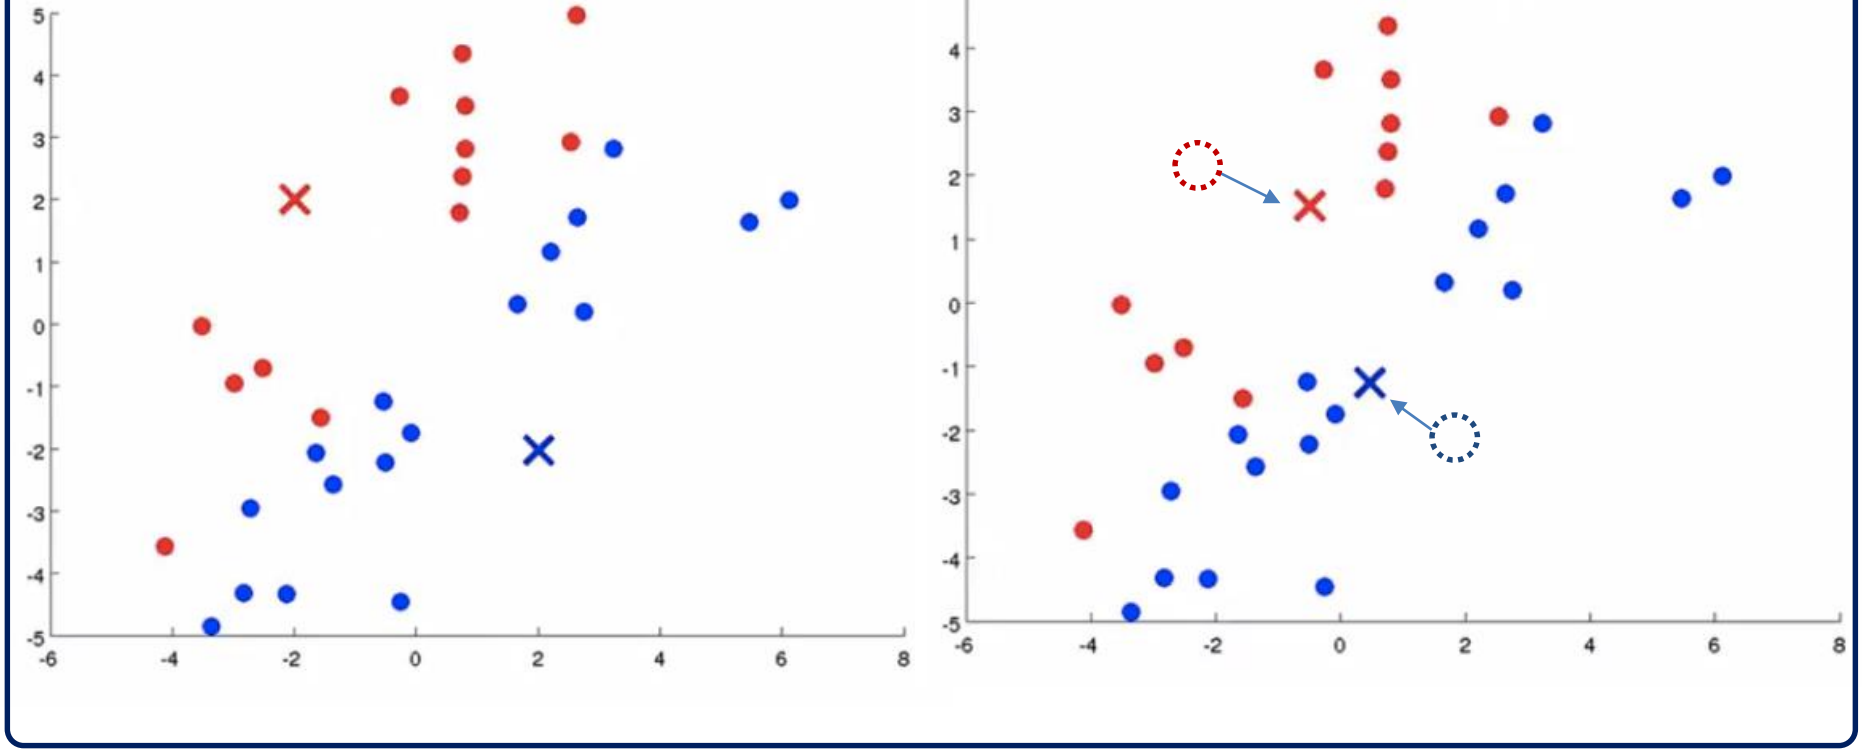
- **Number of cluster k = 2,**
  - **Randomly initialize “centroids”**



** Slides from Andrew Ng(Stanford Univ.), “Machine Learning”*

K-means clustering

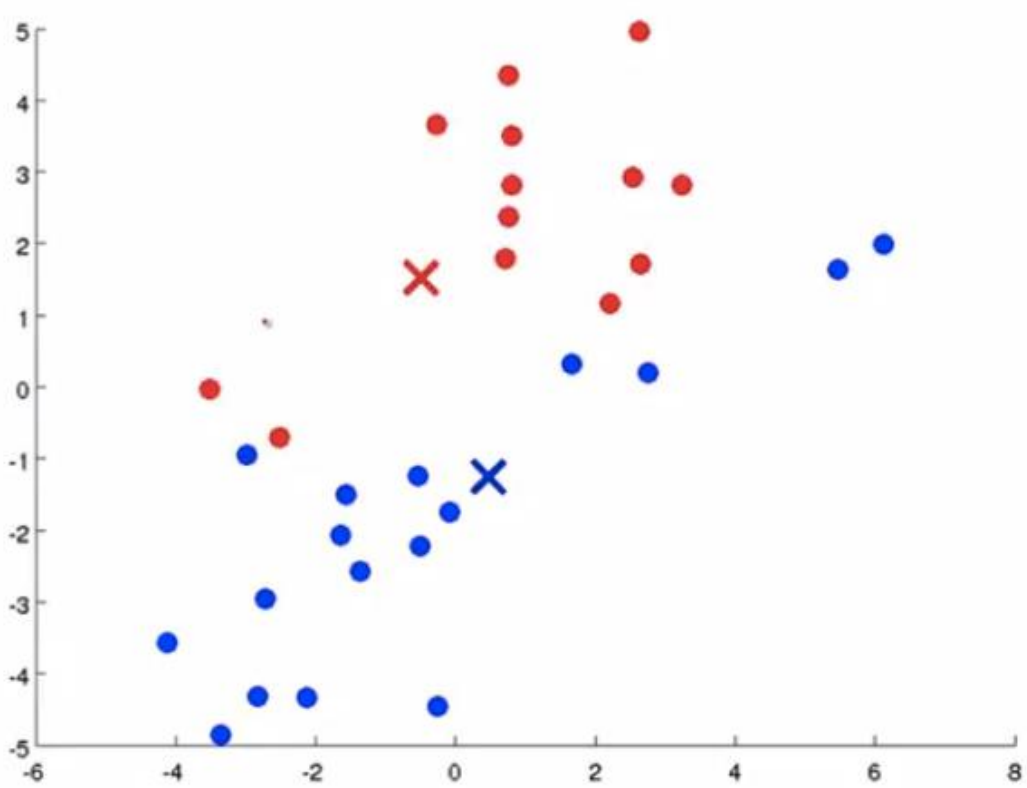
- **Number of cluster k = 2,**
  - Assign cluster membership
  - Update the cluster centroid (average of the data points in each cluster)



** Slides from Andrew Ng(Stanford Univ.), "Machine Learning"*

K-means clustering

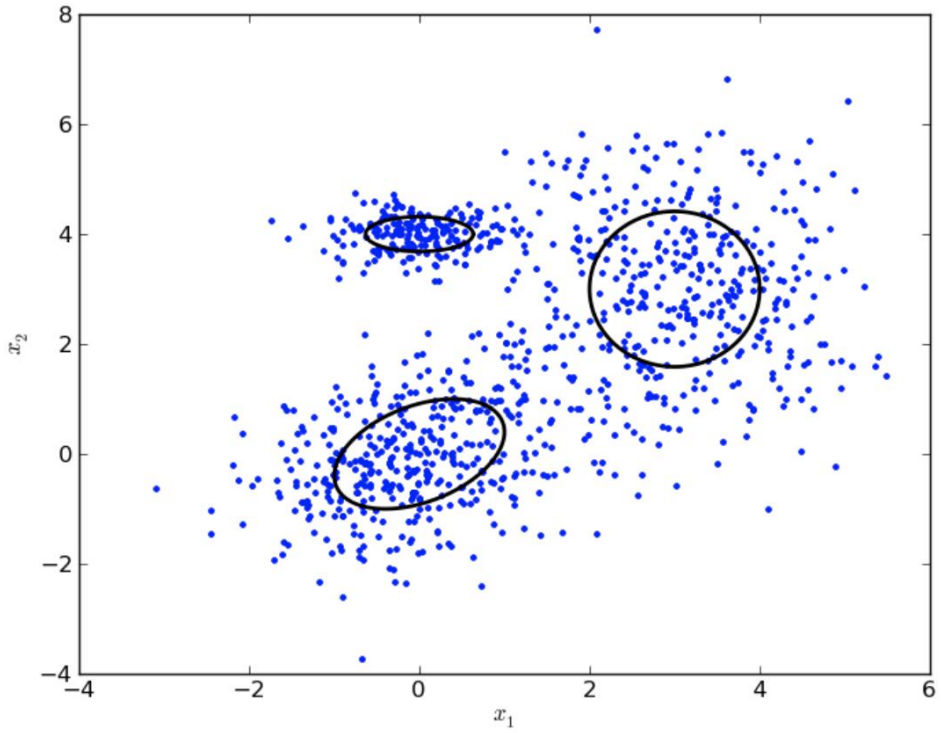
- **Number of cluster k = 2,**
  - Update cluster membership
  - Repeat those procedure until no membership update



** Slides from Andrew Ng(Stanford Univ.), "Machine Learning"*

Gaussian Mixture Model

- The data is composed of 'Mixture' of 'Gaussian'
- The figure below is the result of finding the gaussian distributions assuming that it consists of three gaussian.

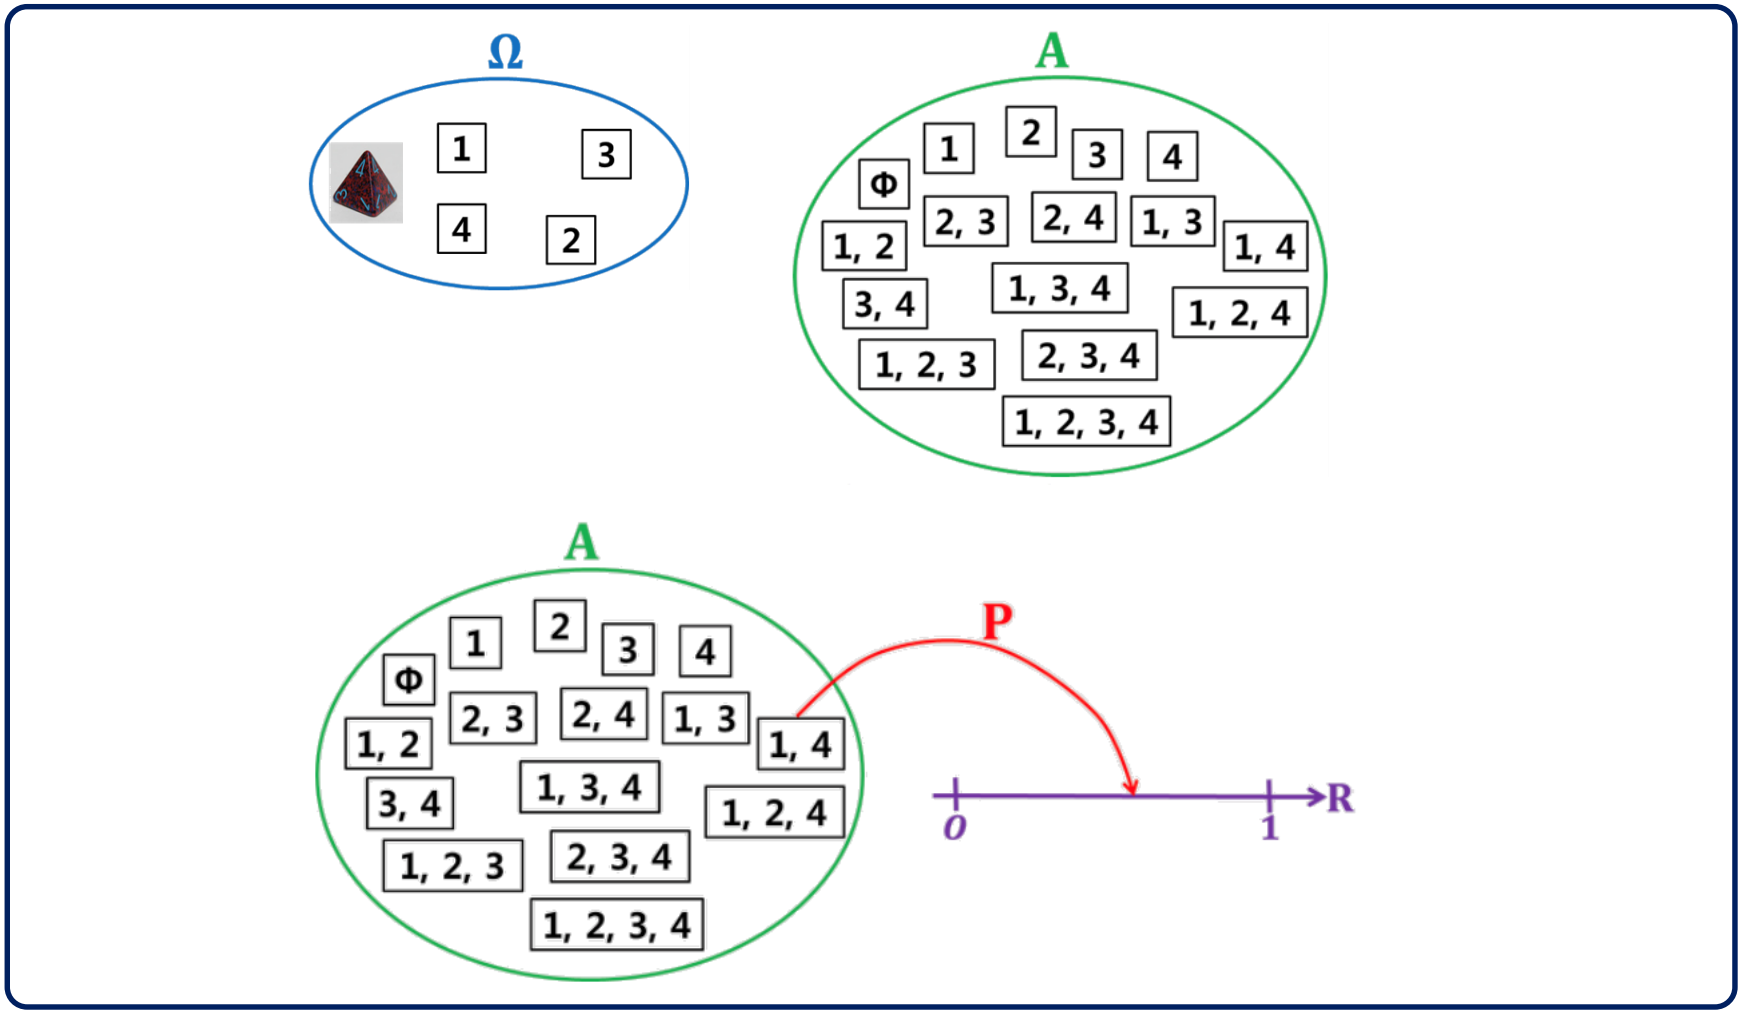


EM Algorithm

- **Probability space**
  - (Ω, A, P)
  - Ω: a sample space
  - A: a set of events
  - P: the assignment of probability to the events

EM Algorithm

- **Probability space** (Ω, A, P)



EM Algorithm

X: Observed data tensor
Z: Hidden data tensor
$p()$: Probability distribution
θ: Parameter

- **Joint distribution**

$$p(\mathbf{X}, \mathbf{Z}|\theta)$$

- **Marginal probability distribution**

$$p(\mathbf{X}|\theta) = \sum_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z}|\theta)$$

http://norman3.github.io/prml/docs/chapter09/4 http://sanghyukchun.github.io/70/

EM Algorithm

X: Observed data tensor
Z: Hidden data tensor
$p()$: Probability distribution
θ: Parameter

- **Marginal probability distribution**

$$p(\mathbf{X}|\theta) = \sum_{\mathbf{Z}} p(\mathbf{X}, \mathbf{Z}|\theta)$$

- **Maximum likelyhood estimation**

$$\max_{\theta} p(\mathbf{X}|\theta) = \sum_{\mathbf{Z}} p(\mathbf{X}, Z|\theta)$$

http://norman3.github.io/prml/docs/chapter09/4 http://sanghyukchun.github.io/70/

EM Algorithm

X: Observed data tensor
Z: Hidden data tensor
$p()$: Probability distribution
$q()$: Probability distribution of Z
θ: Parameter

- **Maximum likelyhood estimation**

$$\max_{\theta} p(\mathbf{X}|\theta) = \sum_{\mathbf{Z}} p(\mathbf{X}, Z|\theta)$$

- **Maximum log likelyhood estimation**

$$\ln p(\mathbf{X}|\theta) = L(q, \theta) + KL(q\|p)$$

$$L(q, \theta) = \sum_{\mathbf{Z}} q(\mathbf{Z}) \ln \left\{ \frac{p(\mathbf{X}, \mathbf{Z}|\theta)}{q(\mathbf{Z})} \right\}$$

$$KL(q\|p) = -\sum_{\mathbf{Z}} q(\mathbf{Z}) \ln \left\{ \frac{p(\mathbf{Z}|\mathbf{X}, \theta)}{q(\mathbf{Z})} \right\}$$

http://norman3.github.io/prml/docs/chapter09/4 http://sanghyukchun.github.io/70/

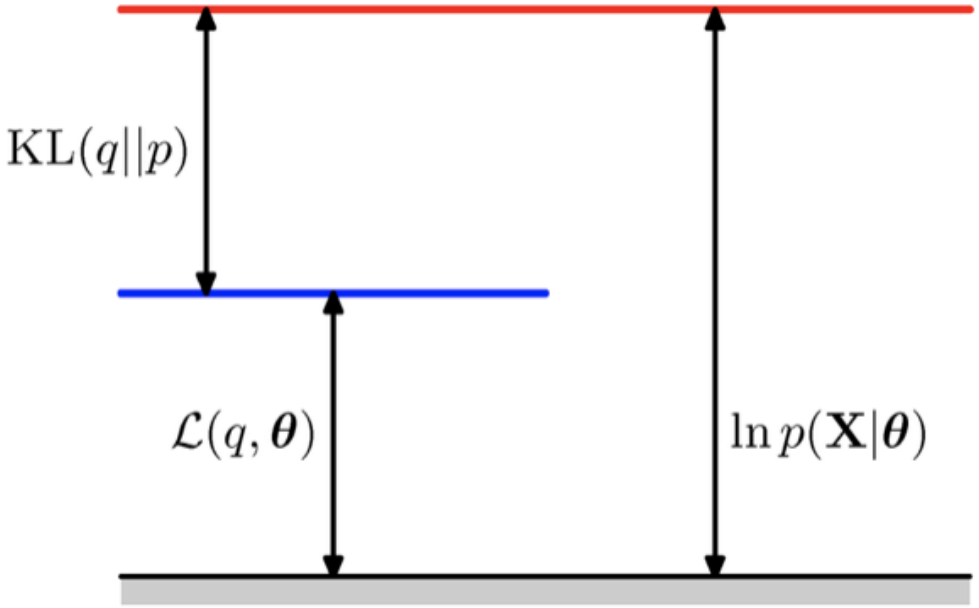
EM Algorithm

X: Observed data tensor
Z: Hidden data tensor
$p()$: Probability distribution
$q()$: Probability distribution of Z
θ: Parameter

- **Maximum likelyhood estimation**

$$\ln p(\mathbf{X}|\theta) = L(q,\theta) + KL(q||p)$$

- **Current status**



http://norman3.github.io/prml/docs/chapter09/4 http://sanghyukchun.github.io/70/

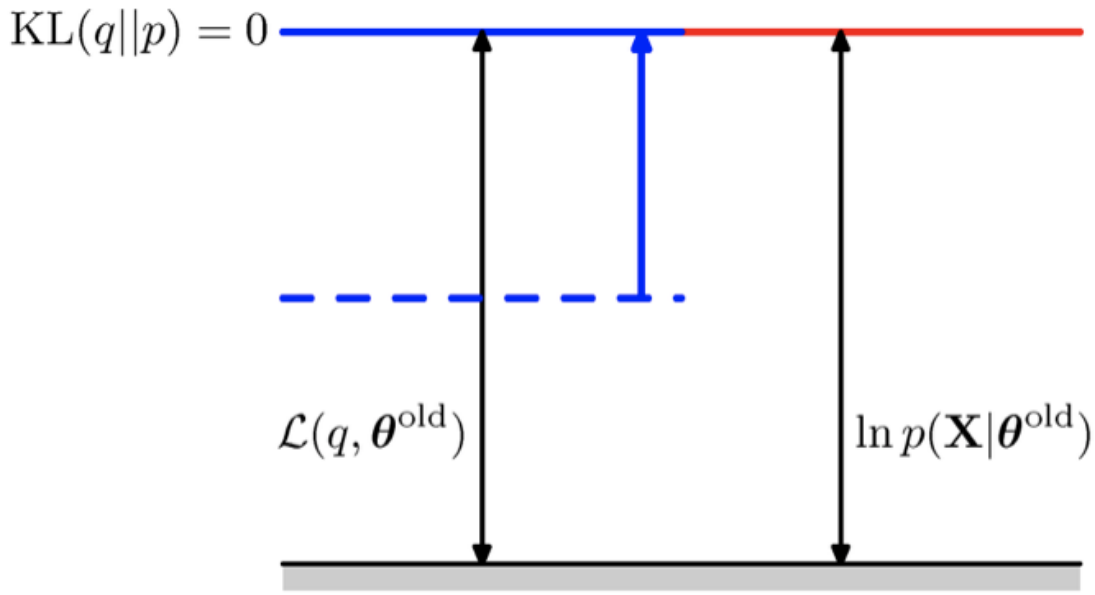
EM Algorithm

X: Observed data tensor
Z: Hidden data tensor
$p()$: Probability distribution
$q()$: Probability distribution of Z
θ: Parameter

- **Maximum likelyhood estimation**

$$\ln p(\mathbf{X}|\theta) = L(q,\theta) + KL(q||p)$$

- **E-step**



http://norman3.github.io/prml/docs/chapter09/4 http://sanghyukchun.github.io/70/

EM Algorithm

X: Observed data tensor
Z: Hidden data tensor
$p()$: Probability distribution
$q()$: Probability distribution of Z
θ: Parameter

- **Maximum likelyhood estimation**

$$\ln p(\mathbf{X}|\theta) = L(q,\theta) + KL(q\|p)$$

$$L(q,\theta) = \sum_{\mathbf{Z}} p(\mathbf{Z}|\mathbf{X},\theta^{old}) \ln p(\mathbf{X},\mathbf{Z}|\theta) - \sum_{\mathbf{Z}} p(\mathbf{Z}|\mathbf{X},\theta^{old}) \ln p(\mathbf{Z}|\mathbf{X},\theta^{old}) = Q(\theta,\theta^{old}) + const$$

- **M-step**
